

# **CHAPTER VI**

## **FARM MANAGEMENT PRACTICES**

### **1 INTRODUCTION**

Ethiopia is endowed with abundant resource suitable for agriculture. As result of which the agricultural activity in Ethiopia is quite varied being conditioned by such factors as climate, soils topography and...etc which had favored not only the employment of the majority of the countries population but also served as the main source of input (raw material) for the countries large and medium Scale industries as well as the main generator of the country's foreign currency earnings.

Though agriculture is the backbone of Ethiopian economy, the sector is characterized by low level of productivity and subsistence farming system, which resulted to hand to mouth production. Nowadays the problem mentioned has become more acute as a result of two factors. First the number of people is increasing at a rate that point to a doubling of the present population of the country at the end of this century. Secondly this is occurring at a time when the area of new land suitable for cultivation is rapidly diminishing.

Even though traditional practice such as use of animal dung and crop residue crop rotation and expanding cultivable cropland had helped a lot to increase productivity, the problem mentioned above has become more acute and beyond the limits of the traditional practices which of course had already been exhausted. Hence, the scale severity and duration of the country's food problem will be so great that a massive short and long-range innovative efforts will be required to solve it.

As a result, increasing productivity on various field crops is the only realistic option to raise the living standards of the rural population, and to ensure food security and poverty alleviation. There are many modern techniques and technologies of achieving enhanced crop productivity. Accordingly, the major factors behind achieving high level of crop productivity increases are greater and more efficient use of fertilizers, wide spread uses of improved variety seeds, pesticides, expanded use of irrigation and effective extension services. Thus, during the 2001/02 Agricultural Sample Enumeration, basic data on agricultural inputs and practices were collected, processed and the results are presented in this chapter.

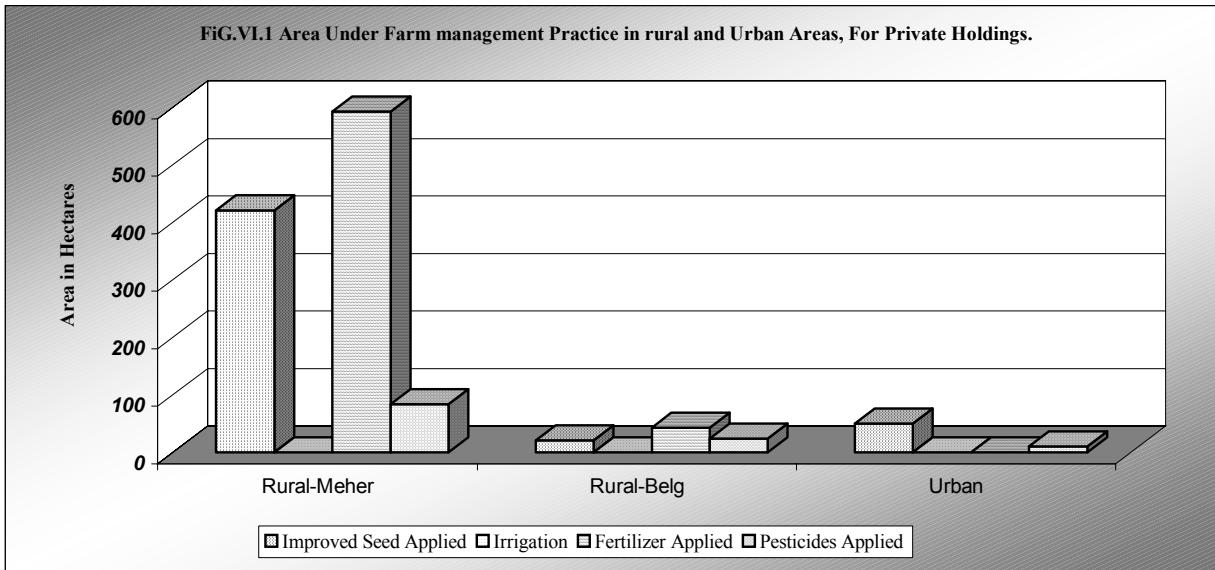

In general, this chapter deals with the agricultural census data that indicates the type of inputs applied, quantity of inputs applied, the irrigated cropland area, estimates of cropland area damage, number of holders who applied different agricultural inputs and farm management practices, and number of holders covered by extension package programs in Gambela Region. Data are presented for private holdings in rural areas for both Meher and Belg seasons, and urban areas of holdings for Meher season. For urban areas, data are collected and presented only to the inputs applied and the irrigated cropland area and number of holders who applied farm inputs. Moreover, estimates, standard errors (S.E) and coefficient of variation (C.V) are given in Annex Tables 6.1 and 6.2.

## **2 CROPLAND AREA UNDER AGRICULTURAL INPUTS AND FARM MANAGEMENT PRACTICES**

This section deals with the agricultural inputs applied and the irrigated cropland area for both rural and urban areas of Gambela Region. Agricultural holders in the sampled households were asked whether they have applied agricultural inputs on their fields or not and the area of all plots operated by the holders were actually measured objectively for private holdings in rural areas. While in urban areas all types of data on farm practices were obtained by interview methods. This helped to estimate area under total crop, irrigated land, fertilizers, pesticides and improved seeds used during the agricultural year. Following data on area under agricultural farm inputs for Gambela Region are briefly discussed.

The census data show that Gambela Region predominantly produces grain crops and the major crops either in terms of the magnitude of area and volume of production includes maize, sorghum and sesame, that accounted for about 71.27% of the area cultivated under all crops (Summary Table VI.2). On the other hand, vegetables and root crops are not widely grown as grains in the region particularly in terms of crop area coverage. As a result, the agricultural inputs were applied to a great extent on the area under grain crops in order to increase the volume of production. Among different types of agricultural inputs that were applied, it is found that fertilizers application had relatively high coverage of area under crops. Moreover, the census data indicate that vast majority of agricultural holders have used agricultural inputs on small size of holdings. In general, the holders in the region as a whole have practiced modern agricultural techniques and technologies but in a much smaller extent.

FIG.VI.1 Area Under Farm management Practice in rural and Urban Areas, For Private Holdings.

## 2.1 Fertilized Cropland Areas

The effects of fertilizers on improving the efficiency of crop production are well known and can scarcely be over emphasized. Moreover, the fertilizing materials and mixture are not restricted to in organic Chemicals but include organic substances such as crop residue animal dung and .. etc. Therefore, Fertilizers refer to anything added to the soil with the intention of increasing the amount of plant nutrients available for crop growth. In the census, data on application, type and quantity of natural and chemical fertilizers were collected. The Natural fertilizers consisted of animal dung and compost while chemical fertilizers consisted of DAP (Di-Ammonium phosphate) and UREA (Ammonium Nitrate).

Although fertilizers are one of the very important agricultural inputs to increase the level of production, in Gambela Region fertilizers, were applied on only 648 hectares (3.91%) of the total cultivated cropland area. Of this total area fertilized cropland, the share of rural areas was found to be 98.15%. Moreover, the proportion of total fertilized cropland areas in rural areas for Meher season was 593 hectares (91.51%) as compared to only 43 hectares (6.64%) for Belg season. Regarding private holdings in urban areas, data are collected and presented only for Meher season. For details, refer to Summary Table VI.1 and Fig VI.1.

Furthermore, out of the total fertilized cropland areas, 82.41% were under cereals, 0.77% under pulses, 2.78% under vegetables, 1.85% under root crops, and 1.24% under fruits 1.54 under

stimulants and 8.95 % under other permanent crops. Most of the fertilized cropland areas in the region were allotted to cereals in both rural and urban areas (See Summary Table VI.1).

With regard to a specific crop, maize is the most important fertilized crop that comprised an area of 71.96% of the total cropland area under fertilizers. The second important fertilized crop is sorghum covering 8.94% of the total cropland area under fertilizers. Enset ranks third taking up 8.63% of the total cropland area under fertilizers. For details, refer to Summary Table VI.2. Moreover, Fertilizer applied Crop land areas by zone for private holdings in rural and urban areas are presented in Summary Table VI.3. As can be seen from this table, the total fertilizer applied cropland areas differ from zone to zone. The census data indicate that Zone-2 has relatively the highest share from the total fertilizer applied cropland area i.e (90.60%) as compared to Zone-1, which is 33.64%.

## **2.2 Cropland Areas Treated with Pesticides**

Pesticides are chemicals that are used for the control or mitigation or elimination of pests that are detrimental to crops. Examples of pesticides are insecticides, herbicides and fungicides. Summary Table VI.1 reveals that the total cropland area treated with pesticides was estimated to be 117 hectares. This indicates that less than one percent of the total cultivated cropland areas were treated with pesticides. Of the total cropland areas treated with pesticides, the share of rural and urban areas was found to be 92.31% and 8.55%, respectively. Thus, private holdings in rural areas had the highest share, while the contribution of the urban areas to the total pesticide applied cropland area was limited in scale. Moreover, the total pesticides applied cropland areas in rural areas of the region for Meher season was 71.79 percent as compared to only 20.51 percent for the Belg season.

Furthermore, most of the pesticide applied land areas in the region was under cereal crops (about 78.63%). Further more, out of all cropland areas on which pesticides are applied, maize accounts for about 84 hectares, which is the highest. For Details, see Summary Tables VI.1 and VI.2. Moreover, Crop land areas treated with pesticides by zone for private holdings in rural and urban areas are presented in Summary Table VI.3. As can be seen from this table, the total cropland areas treated with pesticides differ from zone to zone. The census data indicate that

Zone-2 has relatively the highest share from the total fertilizer applied cropland area i.e (66.36%) as compared to Zone-1, which is 10.26%.

### **2.3 Cropland Areas on which Improved Seeds are Used**

Improved seeds are defined as crop varieties that give significantly higher yield and better quality compared to locally produced varieties of seeds. As illustrated in Summary Table VI.1, the total cultivated cropland area was estimated at 16580 hectares. Of this total, only 492 hectares (5.63% of the total crop land area) was sown with improved variety of seeds. The share of rural and urban areas was found to be 89.84 percent and 10.16 percent of the total cropland areas on which improved seeds are used, respectively. Like other inputs, the private holdings in the rural areas during Meher season had the highest share; while the contribution of the private holdings in urban areas to the total improved seeds applied cropland area in the region was limited in scale. The share of Belg season to the total improved seed applied cropland area is about 4.27% (See Fig VI.1)

Summary Table VI.1 also presents the total cropland area with application of improved agricultural practices and inputs by crop category for private holdings in rural and urban areas. The data in this table indicate that 44.72% and 53.86 % of the total area under improved seeds was reported to be under cereals and stimulants, respectively. While the remaining two percent of the land area on which improved seeds are applied was covered by coffee. In both the rural and urban areas of private holdings, land areas under cereals constituted the highest proportion of improved seeds as compared to other crops.

Moreover, Crop land areas under improved seeds by zone for private holdings in rural and urban areas are presented in Summary Table VI.3. As can be seen from this table, the total cropland area under each agricultural inputs show variation among the zones. The census data indicate that Zone-2 has relatively the highest share from the total cropland area with application of improved seeds (93.29%) as compared to Zone-1 which is 6.71%.

### **2.4 Cropland Areas Under Irrigation**

The necessary increase in crop production, to keep pace with the increased population demand, can be achieved among others by the efficient utilization of Irrigation practices. Moreover irrigation practices make possible the full utilization of advanced technology in farming; these include the proper application of fertilizers, the adoption of good crop rotation practices and the use of best seed varieties.

Irrigated cropland areas refer to the practice where an area of land is purposely and actually provided with water, other than the precipitation obtained from rain to improve the production of crops. The uncontrolled flooding of land by the overflow of rivers or streams is not considered to be as practice of irrigation.

The census data show that the cropland areas that are actually irrigated was only 17 hectares and this accounted for about less than one percent of the total cropland areas. Of course, the mentioned total irrigated cropland areas, was contributed from irrigation scheme operated in the rural and urban areas. (See summary Tables VI.1 and VI.2).

### **3      HOLDERS APPLYING FERTILIZERS, AREA, AND QUANTITY OF FERTILIZERS APPLIED**

In 2001/02 Agricultural Sample Enumeration, the total number of holders applying fertilizers in Gambela Regional State, is estimated to be about 3892. Of these total private holders, about 3862 holders (99.23%) were in rural and about 0.77% in urban areas. The application of fertilizers in Meher and Belg seasons for private holdings in rural areas shows a great variation, that is, 88% of the holders applied fertilizers in Meher season while only 15.39 percent applied in Belg season (See Summary Tables VI.4).

With regard to the type of fertilizers applied, the great majority of holder's applied natural fertilizers (3750). When we come to the utilization of commercial fertilizers, about 239 holders applied DAP followed by a mixture of DAP and UREA (87 holders) and UREA (81 holders). However, the application of chemical fertilizers for Belg season was not reported in census enumeration. In urban areas for private holdings, a total of 30 holders applied natural and chemical fertilizers.

Among the types of fertilizers used, natural fertilizers was applied in larger cultivated cropland area, which is about 429 hectares (That is, 65% of fertilized cropland area). Next to natural fertilizers, considerable amount of cropland area was covered by DAP which is 120 hectares (18%) and a mixture of DAP and UREA was applied on 68 hectares (10%) (See Fig VI.2 and Summary Table VI.4 and VI.5)

Furthermore, the data in Summary Table VI.4 indicated that the total quantity of chemical fertilizers applied by holders in the rural areas was estimated at about 216 quintals, of which, the share of the mixture of DAP and UREA was the highest accounting for about 48 percent of the total quantity of chemical fertilizers applied. This is followed by DAP accounting for about 46 percent, while the share of UREA was the smallest (See Fig VI.3 and Summary Table VI.4).

Moreover, the total amount of Chemical fertilizers applied on crop land areas by zone is presented in Summary Table VI.9. The data in the table shows that the highest quantity of chemical fertilizers application was reported in Zone-2, 90.32% while almost none is reported in Zone-1.

### **3.1 Application of Natural Fertilizers in the Rural and Urban Areas**

According to the census findings, about 3598 holders in rural areas were applied natural fertilizers on 429 hectares of cropland (comprising 66.10% of the total fertilized land area). Of the total cropland area on which natural fertilizers are applied, the share of Meher and Belg season in rural areas was 59.17 and 6.63 percent, respectively. Moreover, of the total land area on which natural fertilizers are applied 74.59% was under cereals, 1.17% under pulses, 3.50% under vegetables, 2.80% under root crops and 1.64% under fruits and 13.52% under other permanent crops. For details, refer to Summary Tables VI.4 .

### **3.2 Application of DAP in the Rural Areas**

As illustrated in Summary Table VI.4, about 239 holders in rural areas have applied DAP on about 120 hectares, which is about 18% of the total fertilized crop land area. Crop land area under the application of DAP varied markedly from one group of crops to another, i.e., 98% of the total DAP was applied for cereals, while the remaining two percent was applied on pulses

and oil seeds crop categories. Variations with respect to specific crops are also considerable, i.e., relatively higher for maize (For details, refer to Summary Tables VI.4 and VI.5).

**SUMMARY TABLE VI.1: Total Area Under Improved Farm Management Practices by Crop Categories in Rural and Urban Areas, Both Seasons, for Private Holdings.**

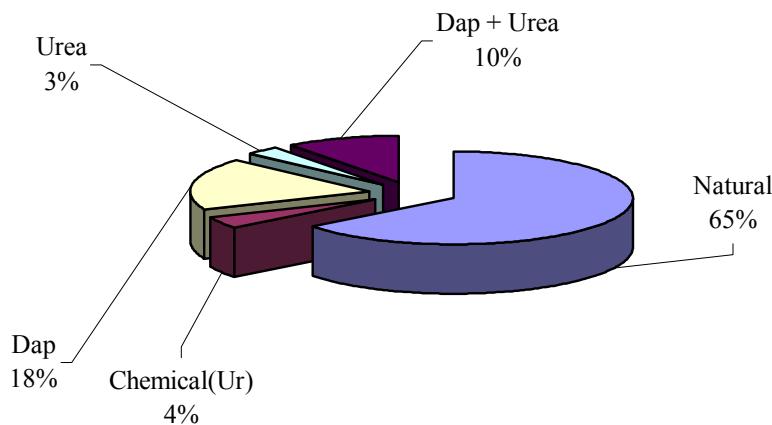

**SUMMARY TABLE VI.2: Total Area Under Improved Seed, Irrigation, Fertilizer, and Pesticide by Type of Crops in Rural and Urban Areas, for Private Holdings**

**Fig. VI.2 Fertilizer Applied area by Type in Rural and Urban Areas For Private Holdings.**

Furthermore, the total quantity of DAP applied in rural areas is estimated to be about 99 quintals, which is 45.83% of the total quantity of chemical fertilizers applied. In general, the quantity of DAP applied was the highest for cereals.

### **3.3 Application of UREA in the Rural Areas**

Although chemical fertilizers have been widely promoted, only 81 holders in rural areas have applied UREA, and the cropland areas under UREA occupied 21 hectares, which is 3.24% of the total fertilizers applied (See Summary Table VI.4 and VI.5).

### **3.4 Application of a Mixture of DAP and UREA in the Rural Areas**

The census findings depicts the fact that quite significant number of holders have applied a mixture of DAP and UREA on their crop fields. As presented in Summary Table VI.6 there were about 87 holders in rural areas who applied a mixture of DAP and UREA on 68 hectares, which is 10.48% of the total area on which fertilizers were applied. The application of a mixture of DAP and UREA to cereals covered 68 hectares. It was observed that the application of a mixture of UREA and DAP is almost non in other crops relative to cereals.

In addition, out of the total quantity of chemical fertilizers applied, the amount of a mixture of DAP and UREA was 105 quintals, which is 48.61% of the total quantity of chemical fertilizers. Of the total quantity of the mixed chemical fertilizers are applied, maize took the highest proportion accounting for almost 100% (105 quintals). For details, refer to Summary Tables VI.4 and VI.5.

## **4 HOLDERS UTILIZING IMPROVED SEEDS AND QUANTITY OF IMPROVED SEEDS USED**

In the 2001/02 Agricultural Sample Enumeration, data on number of holders that have used improved seeds and quantity of seeds used was collected. Hence, the number of holders that have used improved variety seeds and quantity of improved cereal, pulse and oil seeds are presented in Summary Table VI.6.

Furthermore, the total amount of improved seeds used by zone is presented in Summary Table VI.7. The data in the table shows that the highest quantity of improved seeds was reported in Zone-2, 90.32% while it was 9.68 in Zone-1.

### **4.1 Number of Holders using Improved Seeds.**

As portrayed in Summary Table VI.6 the use of improved seeds is limited to only 1849 holders in rural and 87 holders in urban areas of the region. Of the total holders using improved seeds, 40.02% utilized improved teff seed, 33.48% improved sorghum seed, 10.06% improved finger millet seed, and 2.70% utilized improved variety of chickpea seeds.

### **4.2 Quantity of Improved Seeds Used**

Information on quantity of improved varieties of seeds is limited to grain crops only. As can be seen from Summary Table VI.6, the total quantity of improved seeds was estimated to be 62 quintals. The total quantity of improved seeds used has been low for private holdings in rural areas of the region. As can be seen from the data, the low utilization of improved seeds is obviously indicates that holders' continued to rely on low yielding local/traditional seeds.

SUMMARY TABLE VI.5: Number of Holders Applying Fertilizers, Fertilized Area, and Quantity of Fertilizers by Crop Type in Rural and Urban Areas, for Private Holdings

CROP	Application of total Fertilizers		Application of Fertilizers by Type and Quantity					
	Holders	Hectares	Natural			Chemical – DAP

Considering the total quantity of improved seeds utilized, about 72.58% accounted for sorghum followed by finger millet with 14.82%. Details are given in Summary Table VI.6

## **5 FARM MANAGEMENT PRACTICES AND EDUCATIONAL ATTAINMENT OF HOLDERS**

This section of the report presents data on educational attainment of holders in relation to their farm management practices. At the time of enumeration all holders in the sampled households were asked to state their educational attainment. As presented in Summary Table VI.8 data on literacy status and highest grade completed for literate holders were collected.

The census findings indicate that the level of educational attainment of the holders in Gambela Region is very low and this may have a direct impact on the level of awareness of the holders with respect to improved farming activities and is a typical characteristic of peasant community in developing countries. A large number of holders (62.06% in rural and 53.76 % in urban areas) were found to be illiterate while 4.01% in rural and 3.60% in urban areas have participated in informal education. Moreover, the data shows that 25.12% of the holders in rural and 14.71% of holders in urban areas have completed grades 1 to 6 and only 8.13% of the holders in rural and 25.02 % in urban areas have completed grades 7-12.

Furthermore, around 0.67% of the holders in rural and 2.98% in urban areas had completed an educational level of above grade 12 (i.e. college/university). These estimates show that

holders in urban areas are relatively more literate than those in the rural areas. This could probably be attributed to better access to school and/or better awareness of the importance of education among the holders in the urban than those in the rural areas.

Extension packages are outreach programs operating in rural areas for private holdings aiming to transfer modern agricultural technologies to increase crop and livestock productivity. The programs are usually undertaken by follow-up and advisory services by the agricultural development agents. The total number of holders participating in the agricultural extension package programs was 275, which is only less than one percent of the total holders in the region. Of the total holders participating in the extension programs, 245 holders were in Meher season and 30 holders were in Belg season. The distribution of extension package program participants by educational status shows that 23.64% were illiterate, 3.64% have participated in informal education, 58.55% have completed grades 1 to 6 and 6.55% have completed grades 7-12 and 7.64% have completed above grade 12.

As a result of insignificant number of holders who have been exposed to extension packages as well as to education the impact of education on the use of improved farm practices was not clearly exhibited by the census data. The data indicates that out of all holders who have used improved seeds, practiced irrigation, and applied fertilizers and pesticides, 46.51, 36.72, 59.53 and 44.94 percents were illiterate, respectively (For details, refer to Summary Table VI.8).

Furthermore, in each zone, the proportions of the total holders who have applied fertilizers were the highest as compared to other inputs and irrigation. Thus, fertilizers are the most important input and used by 2760 holders (70.91%) and 1132(29.09) in Zone-2 and Zone-1respectively. The second most widely used input was improved seeds and used by 843 holders (87.90%) in Zone-2, while 201holders i.e. about 10.87% in zone-1. For details, refer to Summary Table VI.9.

**SUMMARY TABLE VI.8: Holders Applying Agricultural Inputs and Participating in Extension Programs by Level of Education in Rural and Urban Areas, for Private Holdings**

## **6 DAMAGED CROPLAND AREAS AND SIZE OF HOLDINGS IN RURAL AREAS**

This section of the chapter deals with the estimates of damaged cropland areas by size of holdings in Gambela Region. Cropland area damage includes any cropland planted or sown with intention to harvest crops, but failed to produce crop partly or fully due to various reasons. Out of the total cultivated cropland area, 11.17% in Meher and 3.01% in Belg seasons were affected by crop damage. The cropland area damage that accounted for 28.67% fall under holders in rural areas who had holding size that ranges from 1.01 and 2 hectares. On the other hand, holders in rural areas who had holding size of between 0.51 and 1 hectare accounted for 27.41% of the cropland area damage. With regard to the causes of crop damage, it is reported that 28.73% was damaged due to too much rain, 24.15% was caused by locust, 20.90% was due to crop disease, 11.08% was due to weeds (For details see Summary Table VI.10 and Fig VI.4).

**Fig VI.4 Damaged Cropland Area by causes of damage in Rural Areas, for Private Holdings.**

## 7 FARM MANAGEMENT PRACTICES OF HOLDERS IN RURAL AREAS

In order to obtain more detailed information concerning the various types of farm practices of holders in rural areas, data were collected subjectively by interviewing sampled agricultural holders on the sources of water for irrigation schemes, method to improve soil fertility, method of plowing and soil conservation, participation in extension package programs, and use of credit or advisory services. Hence, the total number of holders reporting different farm management practices and their percentage distribution by type of farm management practices is presented in Summary Table VI.11. Following are discussions of the major findings with respect to these data.

### 7.1 Sources of Water for Irrigation Schemes

In a country like Ethiopia, where the amount, timing and distribution of rainfall is irregular, use of irrigation would significantly improve and raise the level of production. However, irrigation is not extensive in Gambela Region. The census data reveals that of the total holder in the rural areas only 2.07% reported to have used irrigation practices. Among these

SUMMARY TABLE VI.10: Causes of Damage of Cropland Area by Size of Holdings and Seasons in Rural Areas, for Private Holdings

holders who practice this scheme sources of water for 82.34% percent and 14.51 percent of the holders were rivers and lakes, respectively. Utilization of other sources of water for irrigation is limited in the region. It should be noted that data on the number of holders who practice irrigation schemes and the number of holders reporting the sources of water for irrigation were

collected in different period of time during the 2001/02 agricultural activities. In an enumeration area a total of 30 households were systematically sampled that mainly resulted about 30 holders. Thus, the data on number of holders practicing irrigation was collected in September (for ten households) and December (for twenty households). However, the data on the holders reporting the sources of water for irrigation was collected only in March. Hence, some discrepancy is observed in the total numbers of holders who have reported the use of irrigation practices presented in Summary Table VI.8 and VI.11.

During the 2001/02 EASE, an attempt has also been made to assess the extent of irrigation practice in urban areas. Thus, sources of water for irrigation under permanent crops in urban areas for Meher season have been assessed unfortunately the estimates are found unreliable (See Summary Table V1.12).

However, in the same summary table, out of the total crop holders, it is reported that only 343 holders (21.29 percent) in urban areas have practiced Belg crop production in the past three years prior to 2001/02 (1994 E.C.).

## **7.2 Methods Used to Improve Soil Fertility**

The fertility of the soil in Ethiopia is being depleted slowly as time passes because of continuous cropping. In the census, holders were asked to state their method of improving soil fertility, that is whether they use crop rotation or burning of soil. Hence, the data showed that of the total holders about 36.04% have reported practicing crop rotation, while 2.21% reported practicing burning of soil as their main method for improving soil fertility.

## **7.3 Application of Chemical Fertilizers and Reasons for not Applying Fertilizers**

In section 3, it was indicated that about 12.51% of the holders have applied both natural and chemical fertilizers. However, it was less than 1.29% of the total holders that applied chemical fertilizers. In order to gauge the attitude of holders who did not use chemical fertilizers, sampled households were asked the reasons for not using chemical fertilizers. The data in Summary Table VI.11, indicate that the majority of the holders did not use chemical fertilizers due to various reasons. A total of about 10256 holders which is the highest did not use chemical fertilizers due

to lack of knowledge about the advantage, about 3018 holders due to shortage of money, about 9559 holders due to insufficient supply of fertilizers in their area, about 359 holders due to the high cost of fertilizer, 376 holders reported suspecting the efficiency of the fertilizers and about 140 holders reported due to absence of credit service to purchase fertilizers, and about 9394 holders mentioned “other reasons” for not using chemical fertilizers.

#### **7.4 Method of Ploughing**

One aspect to increase agricultural production is through mechanization. The replacement of hand digging and ox/horse driven ploughing method by tractor is of paramount importance for increasing the volume of agricultural production. In light of this, an attempt has been made to collect some basic information on method of ploughing by the holders at the time of the census enumeration. Thus, the majority of the holders (91.95%) reported to have used hand digging method and 3.44% of the holders that used ox/horse driven ploughing methods. Besides, holders who used both hand dug and ox/horse driven methods are accounted for about 3.97%. On the other hand, none of the holders have used tractor-only for ploughing. This ascertained the fact that the use of a tractor for ploughing among the holders in the rural areas of the region is not common or does not exist.

#### **7.5 Methods Used for Soil Conservation**

According to the data in Summary Table VI.11, the majority of the holders reported using different methods of soil conservation. Of which, 1.3, 1,1.87 and 1.54 percent of holders have practiced plowing along the contour, water catchments, terracing and afforestation, respectively. Moreover, 3.29% of the total holders reported that they have other methods for soil conservation.

#### **7.6 Extension Packages, and Use of Agricultural Credit and Advisory Services**

Extension packages are outreach programs operating in rural areas for private holdings aiming to transfer modern agricultural technologies to increase crop and livestock productivity. The programs are usually undertaken through close follow-up and advisory services by the agricultural development agents. A holder is said to be a participant of this program if and only if

he/she obtains agricultural advices, apply the recommended inputs and other related services such as close follow up by the extension agent, supervision by wereda and zonal agricultural bureaus...etc on a regular basis. The prevalence of different types of extension packages were assessed during the enumeration, these include, rain shortage areas package, rain abundant areas packages, post harvest technology packages, ...etc. Thus, the data showed that about 0.94% of the agricultural holders were covered by rain abundant areas extension packages while about 0.83% of the total agricultural holders were covered by rain shortage extension package. The total agricultural holders covered by all other types of extension packages listed in the table are insignificant. In response to why they have not been covered by these extension packages since the program started, holders reported the reasons as follows: 27.98% of the holders reported no knowledge about the advantage 4.09% reported shortage of money, 55.65% reported program not available, 3.15% were suspicious of its efficiency and 1.74% reported other reasons., and 4.41% reported not sufficient arable land available.

In the country, there are institutions that provide credit and assist peasants by furnishing short and intermediate term loans for the purchase of chemical fertilizers, improved variety seeds, and pesticides. These institutions not only give great emphasis to making loans to peasants but also aiding them with advice on farming practices. Then, data are collected by interviewing sampled holders on use of credit and advisory services and are presented in Summary Table VI.11. Thus, the data in this table showed that about 7.6 percent of holders used agricultural credit services and about 1.06 percent of the holders have obtained advice on agricultural practices. This shows that the use of credit and advisory services were limited in scope.

## **7.7 SOURCES AND COST OF CHEMICAL FERTILIZERS.**

As illustrated in Summary Table V1.13, it is estimated that a total of 259 holders (0.97%) reported “Government” as their major sources of chemical fertilizers, while about 49 holders (0.18%) private organization as their major sources of chemical fertilizers. Regardless of the source, the average cost was 264.07 Birr/Quintal for DAP and 196 Birr/Quintal for UREA.

## **8 USES OF CROP SPECIFIC EXTENSION PACKAGE PROGRAMS**

Extension package is one of the means by which productivity improves and thereby food production increases. Moreover, Agricultural Development Agents (ADA) assist the peasants by

operating demonstration plots to provide information to agricultural holders on improved seed varieties, on use of fertilizers and pesticides, and improvements in production practices to increase yields. Further, advisory services are provided to holders to those who are willing to participate in the extension package programs.

### **8.1 Holders Participating in Crop Specific Extension Package Programs**

In rural areas the distributions of holders participating in crop specific extension package programs are presented in Summary Tables VI.14. Accordingly, about 275 holders have been participating in crop specific package, that is, maize, by about 210 holders followed by sorghum by about 73 holders.

SUMMARY TABLE VI.11: Number of Holders by Type of Farm Management Practices  
in Rural Areas, for Private Holdings

## 8.2 Area Under Crop Specific Extension Package Programs

In the 2001/02 EASE, data on cropland area under extension package programs was collected. Thus, Summary Table VI.14 shows that a total of 83 hectares (0.50% ) of the total cropland area was under extension package programs. Out of the total cropland area under extension package programs, 72.29% was observed under maize, followed by sorghum. As can be observed from the data in the table, most of this extension package programs were mainly

practiced in Meher season and the participation of holders in these programs are insignificant in Belg season. For details, see Summary Table VI.14

**Summary Table VI.14: Number of Holders Participating Crop Specific Extension Package Program and Area under Crop Specific Extension Package Program  
By Season in Rural Areas, for Private Holdings.**
