

Documentation MICS for Lesotho

Size

Households: [7471]
Household members: [32744]
Women: [6741]
Children: [3737]

Household identification : Hid
Household members identification : Hhmid

Type of weights : Self-weighted

Notes on Data File

1. The data is self-weighted and may be presented at a the sub-national level of ecological zones “urban”, “rural”, “foothills” and “mountains”. The zone “mountains” comprises the Senqu River Valley (SRV) stratum. Though it would have been ideal to maintain SRV as a separate stratum, doing so would have necessitated a much larger sample size to detect a difference between it and any of the other zones. Alternately, a grouping of the districts into 4 or 5 strata would allow reliable estimates to be obtained. Depending on the standard error, variables that relate to all (or a very large number of cases), such as access to water and sanitation may be presented at the district level.
2. The response rate was very high (99.7%) for all households. This translates to an overall response rate of 97.4 on the required sample size of 7600. The MICS2 estimates are therefore reliable.
3. Nearly 20% of children were not included in the anthropometry analysis. At least half of them (388 children) were excluded because no height measurement was obtained. Anthropometric measurements relying on weight and age only are reliable for all the children. Further analysis is required for using indices including height measurements.

Variables List

Household (HH.sav)
