

## Labour Force Survey 2003:1 Meta-data

The Labour Force Survey 2003:1 data is in three files. The files are flat, ASCII, fixed field files, with one line of given length per record. This format was chosen so as to make the data usable with as many statistical programs as possible, and thus accessible to as wide a range of people as possible.

Other important information for users is found in the:

- ◆ Questionnaire
- ◆ Additional code lists (occupation, industry, education)
- ◆ Relevant publications
- ◆ Web-site ([www.statssa.gov.za](http://www.statssa.gov.za))

### THE DATA FILES

The files and the corresponding sections of the questionnaire are as follows:

**PERSON:** Data from Flap and Section 1

**WORKER:** Data from Sections 2, 3, 4 and 5

**STRATUM\_PSU:** Stratum and PSU numbers

The files also contain some derived variables.

The information in each file contains the following:

- Nature of records in the file and population covered
- Description of variables

### Description of variables

The description of the variables comprises the following information:

**Descriptive name:** This is a short English description plus the variable name in the original file used by Stats SA to construct the ASCII file.

**Position of the variable:** The position of the data within the record, recorded in the format (@xxx y.). “@xxx” indicates that the data begins at position (i.e. column) xxx and “y.” indicates that it is y digits wide. All data is numeric. All data is right-justified.

**Source:** This is either the question in the questionnaire or, for derived variables, the method of derivation. Derived variables are usually found towards the end of a record.

**Valid range:** The range of valid values for the variable. For continuous variables this reflects the upper and lower limits as found in the data.

**Not applicable:** The code for not applicable is provided for each variable. These are now numeric.

**Missing value:** A code for “missing”/unspecified values is given for each variable.

**Notes:** Specific observations to be noted by users.

Most questions in the Labour Force Survey questionnaire are pre-coded, i.e. there is a set number of choices from which one or more must be selected. For open-ended ‘write-in’ questions, the description will note that post-coding occurred and explain how this was done. For most variables the coding is apparent from the questionnaire (available elsewhere in the

documentation) and is not repeated in the variable description. Where the coding is not apparent, the description either provides the codes or indicates where code lists are to be found.

## Linking files

The data from different files can be linked on the basis of a record identifier. The record identifier is the first field/s in each file. Each record contains a number (UqNr) which constitutes a unique household identifier. All records with a given household identifier, no matter which file they are in, belong to the same household. For individuals, a further two digits constitute the Person number (PersonNr). When these are added to the household identifier, a unique individual identifier is created. Again, these can be used to link records from the PERSON and WORKER files. The syntax needed to merge information from different files will differ according to the statistical package used.

## METHODOLOGY

### Sample design

A sample of 30 000 dwelling units was drawn from 3000 primary sampling units (PSUs) (that is 10 dwelling units per Primary Sampling Unit (PSU) from the Master Sample. A two-stage sampling procedure was applied and the sample was stratified, clustered and selected to meet the requirements of probability sampling. The Master Sample is based on the 1996 Population Census enumerator areas and the estimated number of dwelling units from the 1996 Population Census. The EAs were grouped within a province by urban/rural, and a disproportional sample of EAs was taken from each group (stratum). Within each explicit stratum the PSUs were stratified by simply arranging them in geographical order by District Council, Magisterial District and, within the magisterial district, by average household income (for formal urban areas and hostels) or EA. The allocated number of EAs was systematically selected with probability proportional to size in each stratum. The sample was explicitly stratified by province and area type (urban/rural).

The careful and scientific selection of the PSUs was the first stage of the sample selection. These PSUs then need accurate identification in the field, particularly the boundaries of the PSUs. These identified PSUs must match those areas selected from 1996 census records. After boundary identification the next stage is to list accurately all the dwelling units in the PSU. A PSU is either one EA from the Census or several EAs when the number of dwelling units in the base or originally selected EA from the census was found to have less than 100 dwelling units. Each EA should have approximately 150 dwelling units but it was found that many contained less than that. Thus, in some cases it has been found necessary to add EAs to the original EA to give our minimum requirement of 100 dwelling units in the first stage of primary sampling units (PSUs). PSUs in the Master Sample consist of 100 to 2445 dwelling units. Special dwellings such as all prisoners in prisons, patients in hospitals, people residing in boarding houses and hotels (whether temporary or semi-permanent), guest houses (whether catering or self-catering), schools and churches are excluded from the sample.

The second stage of the sample selection is from the dwelling unit listing. A systematic sample of 10 dwelling units was drawn from each PSU. However, if there was growth of more than 20% in a PSU, then the sample size was increased systematically according to the proportion of growth in the PSU. The same dwellings will be visited on, at most, five different occasions. After this, new dwelling units will be included for interviewing from the same PSU in the Master sample. This means a rotation of 20% of dwelling units each time the LFS is conducted.

### Weights

In practice survey data suffer item and unit non-responses thus increasing sampling errors and introducing bias into the data. There are two main techniques for handling non-response problems, namely re-weighting and imputation. LFS sample is designed in two stages. In the first stage primary sampling units (PSU) are selected with probability proportional to size (PPS) from the census population. The PSU inclusion probability is given by

$$P_{PSU} = \frac{n_{PSU}}{N_{PSU}} n_s,$$

where  $n_{PSU}$  is the number of households constituting the selected PSU during census fieldwork,  $n_s$  is the number of PSUs per stratum, and  $N_{PSU}$  is the number of households constituting the selected stratum during census fieldwork. For LFS we consider urban and rural strata. In the second stage dwelling units are selected sequentially from each PSU in the sample to form clusters of ten dwelling units. The household inclusion probability per PSU is given by

$$P_{HH} = \frac{n_{HH}}{H_{HH}} r_{HH},$$

where  $n_{HH}$  is the number of selected dwelling units per PSU,  $H_{HH}$  is the number of household in the PSU in question at a particular time different from the census time, and  $r_{HH}$  is the response rate given by  $r_{HH} = \frac{n_{RESP}}{n_T}$  where  $n_{RESP}$  is the number of responding households and  $n_T$  is the total number of visited households per PSU. The adjusted sample weights are now given by

$$W_{HH} = \frac{1}{P_{PSU} \cdot P_{HH}}$$

We use a SAS macro called CALMAR developed by some French men to benchmark  $W_{HH}$  to the mid-year estimates. The mid-year estimates are adjusted to give population estimates during survey fieldwork.

### Estimation and use of standard errors

The published results of the Labour Force Survey are based on representative probability samples drawn from the South African population, as discussed in the section on sample design. Consequently, all estimates are subject to sampling variability. This means that the (sample) estimates may differ from the figures (i.e. population figures) that would have been produced if the entire South African population had been included in the survey. The measure usually used to indicate the likely difference between a sample estimate and the corresponding population figure is the *standard error (SE)*, which measures the extent to which an estimate might have varied by chance because only a sample of the population was included. There are about two chances in three that the sample estimate will differ by less than one standard error from the population figure and about 19 chances in 20 that the difference will be less than two standard errors. Another measure of the likely difference is the *relative standard error* (or the *coefficient of relative variation, or CV*) which is defined as the standard error of the estimate divided by the size of the estimate, and is usually expressed as a percentage.

There are two major factors which influence the value of a standard error. The first factor is the sample size. Generally speaking, the larger the sample size, the more precise (accurate) the estimate and the smaller the standard error. Consequently, in a national household survey such as the LFS, one expects more precise estimates at the national level than at the provincial level due to the larger sample size involved. The second factor is the variability between households of the parameter of the population being estimated, for example, the number of unemployed persons in the household.

For every survey, Statistics South Africa now calculates the standard errors and relative standard errors for a variety of the estimates shown in its publications. Estimates are calculated, not only of various population parameters but also for the many subclasses of the country, which include segregated classes (e.g. explicit strata, such as provinces or urban/rural division or combinations of these) as well as cross-classes (e.g. gender, age groups, gender by age groups). These different subclasses represent a large variety of sample sizes. Smoothing of the calculated standard errors is obtained by fitting regression models to the relative standard errors, which are then represented in graphical form. Given the size of the estimate and the population parameter under consideration, an approximate value of the relative standard error of the estimate can be obtained (read off) from the relevant graph. Multiplication of this approximate value of the relative standard error with the estimate itself then gives an approximate value of the SE of the estimate, viz.

$$(1) \quad SE(\text{estimate}) = CV(\text{estimate}) \times \text{estimate}$$

The formula in this form, however, is not applicable to ratio estimates, such as the unemployment rate, and has to be changed to:

$$(2) \quad SE(\text{ratio estimate}) = CV(\text{ratio estimate}) \times (\text{numerator of ratio estimate})$$

For example:

$$(3) \quad SE(\text{Unemployment rate}) = CV(\text{Unemployment rate}) \times (\text{est. no. of unemployed persons})$$

Note that there are **different graphs** to be used for the different population parameters for obtaining the CV estimate.

The **95% confidence intervals of a population parameter** can be obtained as follows:

$$\text{lower 95\% confidence limit of a population parameter} = \text{estimate} - 1.96 * SE(\text{estimate})$$

and

$$\text{upper 95\% confidence limit of a population parameter} = \text{estimate} + 1.96 * SE(\text{estimate}).$$

The *confidence coefficient*, i.e. 95%, of a 95% confidence interval of a population parameter could be interpreted as the success rate of the calculated confidence interval, viz.

$$\{\text{estimate} - 1.96 * SE(\text{estimate}); \text{estimate} + 1.96 * SE(\text{estimate})\}$$

to include or to contain the value of the population parameter.

## Example:

Calculating the standard error of the unemployed according to the official definition. Note that the estimated number of unemployed is 4525 000. Mark this on the graph and read off the corresponding coefficient of variation. In our case it is 0,0181 and 0,0129 for the unemployed and unemployment rate respectively.

Applying formula (1) the standard error for the unemployed will be  $0,0208 \times 5250\ 000 = 108\ 950$ .

Applying formula (2) the standard error for the unemployment rate will be  $0,0143 \times 31.2 = 0.45$

This implies that the 95% confidence intervals of the unemployed and the unemployment rate are  $5250\ 000 \pm (1,96 \times 108\ 950)$  and  $31.2 \pm (1,96 \times 0.45)$  respectively. The graphs are attached as appendices 1 and 2.

To calculate your own standard errors you will need the PSU number and the strata. This can be obtained by linking the file Stratum\_PSU with the Person or Worker file.

<b>B</b>	<b>Has ..... stayed here</b> (in this household) <b>for at least four nights on average per week during the last four weeks?</b> 1 = YES 2 = No → <b>End of questions for this person</b>
----------	---

#### **Note to users**

This question is asked for each person found in the selected dwelling. Those who are not household members (those who haven't spent at least four nights per week) would be eliminated on the second category (2 = No). The instruction in this question is to end the interview with those who have answered "No" in this question. It is through this question where household members are identified within the selected dwelling.

#### **Universe**

Every person who has stayed in the households in selected dwelling units at least four nights a week in the four weeks prior the interview.

*Stayed September (B\_Sept02)*

(@18 1.)

B2. Did ..... stay in this household in September 2002 ?

<b>B.2</b>	<b>Did ..... stay in this household in September 2002?</b> 1 = YES 2 = No
------------	---

**Note to users**

This question is asked for each person found in the selected dwelling. It seeks to find out if the household members who are present in the household during the survey were also present during the survey conducted in September 2002. It is through this question that permanent household members are identified within the selected dwelling.

**Universe**

Every person who has stayed in the households in selected dwelling units at least four nights a week in the four weeks prior the interview.

**Final code list**

1 = Yes

2 = No

9 = Unspecified

*Gender (Gender)*

(@ 19 1.)

Is ..... a male or a female?

<b>C</b>	<b>Is ..... a male or a female?</b>
	1 = MALE
	2 = FEMALE

**Note to users**

This question is asked for all household members, to determine their gender. This question is only applicable if there is a "Yes" in the previous question, which determines whether a person is a household member or not. The enumerators are instructed not to assume the gender of the members of the households by just looking at people's names or physical appearances. In this instance they have to ask the respondent the gender of each member of the household without any assumptions.

**Universe**

Every person who has stayed in the households in selected dwelling units at least four nights a week in the four weeks prior the interview

**Final code list**

1 = Male

D. How old is .....? (*In completed years*)

<b>D</b>	<b>How old is .....? (In completed years - In figures only)</b> <i>Less than 1 year = 00.</i>
----------	--

### Note to users

This question is asked to find out the age of the household members. This is asked for each member of the household. The instruction is to write the years in whole numbers and not in words. Moreover, these years must be completed, thus if a person is two years and six months, the instruction is to write the two completed years. For those children who are less than a year, the instruction is to write 00.

### Universe

Every person who has stayed in the households in selected dwelling units at least four nights a week in the four weeks prior the interview.

----------	---

### Note to users

This question is asked to determine the population group of persons from the selected dwelling. The respondent must answer for each member without any assumptions. In this instance the enumerator is also instructed not to make any conclusions, which may be influenced by his observation or using people's names during the interview. This question may seem very sensitive to some respondents especially in this post apartheid era, but it is really important to find out the composition of the South African population.

### Universe

→ **Go to Q 1.2**

#### Note to users

This question is about the marital status of the members of the household. There are different kinds of marriages in South Africa, even if a couple is living together as husband and wife they are regarded to be married. Both modern and traditional marriages are considered in this question.

If the response is widow/widower, divorced or separated and never married the enumerator is instructed to go to Q 1.2, which is on language most often spoken at home.

#### Universe

Every person who has stayed in the households in selected dwelling units at least four nights a week in the four weeks prior the interview.

	} → Go to Q 1.7.a

### Note for users

This question seeks to establish how many people have vocational training because of the increased recognition of the importance of this sort of training. Vocational training can help people earn a living either by getting a (better) paying job or by starting their own businesses. The instruction to the interviewer is to go to Q1.7.a if the answer to this question is NO or DON'T KNOW.

This question is asked for all household members, to determine their gender. This question is only applicable if there is a “Yes” in the previous question, which determines whether a person is a household member or not. The enumerators are instructed not to assume the gender of the members of the households by just looking at people’s names or physical appearances. In this instance they have to ask the respondent the gender of each member of the household without any assumptions.

### Note to users

This question is applicable to all household members. The enumerators are instructed that it is only those qualifications already obtained which must be entered. That means the current level, whereby a person is still busy with is not applicable. It is very important to complete each record even if the person has not attended school. Moreover the enumerators are instructed that diploma and certificates must be of at least six months duration.

### Note to users

This question is applicable to all household members aged 15 and above, regarding their involvement in the economic activities in the seven days prior the interview. This is part of the questionnaire where there would be a differentiation between economically active population and those who are not economically active. The instruction to the enumerators is that these activities must be for at least one hour within the seven days. In order to be certain that the categories have been answered there should either be “Yes” or “No” in all of them. Most importantly, is that if there is “Yes” to any part of this question there should be skip to Section 4. If all the categories are “No” there should be a continuation to the next question.

#### Note to users

This question is applicable to household members who have been performing certain economic activities in the seven days prior the interview (from Q 2.1 and Q 2.2: “Yes”). This question is only applicable if there was no answer in Q 4.15.a, thus in case of a non-response, refusal or don’t know. Since this kind of information is very personal the enumerator is instructed to show a “score card” to the respondents for them to choose the category in which they fall. They are also asked to inform the respondent that there are certain closures (Acts) that protect individuals in cases of these nature, so Statistics South Africa as a government department is therefore compelled to abide by them.

### *Official employment status (Status1)*

(@177 1.)

Derived variable: Derived from a logical series of steps involving Worked past 7 days, Job although absent, Work category, Reason absent from work, Acceptance of job, Time to start work, Work seeking action.

Note: The difference between this and the following variable is that, to qualify as unemployed, a person needs to be willing to accept work within a week and have taken action to find work during the past month. If these conditions are not satisfied, the person is classified as not economically active.

Valid range: 0 – 2

*PSU (PSU)*

(@181 7.)

Primary sampling unit.

Valid range: 1011001 - 9312247

*Weight (Person\_Wgt)*

(@188 8.4)

Derived variable: as explained on pages 2 and 3.

This is the individual/person weight, identical to that in the PERSON file.

Valid range: 54.76441777 – 3967.7509585

**DATA FILE: STRATUM\_PSU**

The LFS' is based on multistage stratified cluster sample (i.e. complex samples). The sampling population is first stratified into explicit strata, then pre-specified numbers of primary sampling units (i.e. PSU's) are drawn in the strata, whereupon a fixed number of households are drawn in each drawn PSU's. The consequence of this is that statistical techniques of analysis based on a simple random sample design will give liberal (i.e. too significant) results. This is the case with most generally available statistical software packages. However, dedicate software is available which takes the complexity of the of the sample design into consideration and which requires stratum and PSU numbers. The STRATUM\_PSU data file is supplied for this type of analysis and can be merged with any of the other three data files i.e. PERSON, WORKER and HOUSE by the variable unique number (UqNr), position 1 to 13.

This file contains stratum and PSU numbers.

*Unique number (UqNr)*

(@1 13.)

Unique household identifier

Note: This is the unique household identifier which can be used to link data from this file with data for the same household from other files.

*Stratum number (Stratum)*

(@14 2.)

**Please Note:** To get rid of non-existing stratum numbers all records with invalid weights should be deleted after merging
