INTRODUCTION¹

The first report had the principal results relating to the social indicators of the investigation on the Questionnaire of the Basic Indicators of Wellbeing (QUIBB), the first investigation of this kind realized in our country. This will be followed by a publication relating to the household expenses, the poverty profile, the appropriations and savings of the households and finally the community activities and the perception of their living conditions.

The investigation was carried out from April 14 to July 11, 2005 and relates to a sample of 6,700 households. The questionnaire used was a standard questionnaire developed by the World Bank, the UNDP, the UNICEF and the ILO. The QUIBB provides the principal basic indicators of the well-being, relating to the elimination of illiteracy of the adults, basic education, health and the nutrition, the access to drinking water and employment. The indicators of education and health are centered on the use, the access and the quality of the provision of provided services. The investigation also determines the characteristics of the habitat, the assets, the access to the community infrastructures (markets and services of public transport) and the perception of the households on their own economic situation and that of their community.

The specificity of the QUIBB is due to the fact that it tried out and made a success of the use of the data processing by optical character reading. Thus, all the procedures of treatment are standardized and automated. This technique of investigation made it possible to shorten the times of processing the data and the diffusion of the results. The principal results obtained constitute priceless contributions for obtaining reliable data and brought up to date for the follow-up of the Strategy of Reduction of Poverty (SRP) and the Objectives of the Millennium for Development (OMD).

1.1: Context and objectives

Niger is a country in the Sahel region marked by strong instabilities on the climatic level and by a very high vulnerability from an economic standpoint and food. It is one of the vastest countries of West Africa with a surface of 1,267,000 Km². It is equipped with very weak natural resources. Only 12% of its surface favors subsistence agriculture, which occupies 85% of its population and the three quarters of this population live on the southern fringe favorable with agriculture. Moreover, its demographic growth increase was estimated on average at 3.3% per annum between the general census of the population of 1988 and that of 2001. This demographic growth involves new requirements in basic essential services.

On the one hand, the drastic climatic conditions, the strong demographic pressure, decrease in soil fertility, the degradation of the natural resources (water, soil, pasture, forest) strongly contributed to increased vulnerability of the households natives of Niger and, on the other hand, the economic evolution of the country, during the period 1990-2000, was characterized by a weak growth with a real rate annual average of 1.9%.

The interaction of these factors had a consequence of precariousness of the living conditions of the population.

The diagnosis established within the framework of the preparation of the round table on poverty in Niger showed that the phenomenon of poverty takes on a general, multidimensional character and appears on all the levels:

1. On the level of the State: the budgetary resources, in stagnation since many years, vis-à-vis a fast growth of the population in same time, do not make it possible any more to release the means of operation and investment which require the maintenance of the quality of the rates of schooling and medical cover, remained among the low in the world.
2. On the level of the population: according to the profile of poverty in Niger, a strong proportion of the population does not manage to satisfy its essential requirements in food, housing, healthcare, to quote a few. With an IDH of 0.281 Niger is classified 177th on 177 countries in 2003.

To comprehend the living conditions of the households, several studies and investigations were carried out. The examination of the whole of this work shows that the current information system provided an important effort of collection. However, the data available making it possible to determine the standard of living of the population is either outdated or

¹ Introduction translated from the Niger's report

partial. Indeed, the data having been used for the realization, in 1994, from the first study on the "Profile of Poverty" in Niger date back from 1989/1990 (for the urban environment) and 1992/1993 (for the rural area). With regards to the efforts made by the various Governments which followed one another since 1992 to reduce the suffering of the populations and especially, with the actions carried out on the ground within the framework of the Strategy for Reduction of Poverty, it is probable that it has provided a structural change for this poverty profile. Consequently, it proves to be necessary to have recent data which can, *inter alia*, not only to account for the width of the phenomenon and its factors, but also to make it possible to identify the target population. These data must make it possible to produce several indicators translating the living conditions of the households.

Also, for a better evaluation of the projects and programs for development, the decision makers, just like the researchers need suitable indicators of the level of development of various sub-groups of population. The indicators at the national level are total and generally insufficient for the needs of planning. In addition, data-gathering for the calculation of the traditional indicators of impact measuring the changes of (1) Investigation with multiple indicators by the end of the decade, December 2000 (2) Strategy of Reduction of Poverty: Complete SRP, January 2002 (3) world Report on the Human Development in the world, UNDP 2005; level of development (for example, percentage of population below the poverty line, the number of children suffering malnutrition, etc.) must be regular, but is expensive and proves to be tiresome. To mitigate these various constraints partly, in particular the long time of processing data, a group of partners to the development whose World Bank developed a new technology of processing data of investigation (optical character reading, automatically generated standard tables) called Questionnaire of the Basic Indicators of Wellbeing (QUIBB). It is conceived, primarily to allow the follow-up of the indicators of poverty and the effects of the policies, programs and projects for development on the living standards of the households. It uses simple indicators for principal objective the identification of the groups of populations vis-à-vis to the various actions conceived to improve the social and economic condition. It is a powerful tool of quantitative of the indicators and qualitative follow-up (perception of the users on the provisions of services of education and health). Several indicators of the QUIBB can be used for the follow-up of the SRP and the indicators of the OMD. They are the level gauges of life, of the indicators of access, use and satisfaction of the public services.

The various results which rise from this study must then be located within this framework of the economic situation.

The period during which the data-gathering took place, calls for observations on the food situation of the country. Indeed, the premature stop of precipitations in 2004 and the damage caused by the invasion of locusts on crops and pastures in certain parts of Niger caused an acute food crisis, initially in the pastoral and agro-pastoral zones, then before spreading with the whole of the country. For this agricultural season 2004, the Government of Niger had evaluated the cereal deficit with 223,500 tons and the fodder deficit to 4.6 million tons. Moreover, the cattle, principal richness of the rural households of the pastoral and agro-pastoral zones, are also threatened because of insufficient pastures and the fodder deficit.

This food crisis caused an unexpected rise of the prices on the local markets, leading the Government to proceed to a sale of the cereal products at moderate price (price lower than that practiced on the market) and to a free distribution in certain localities.

In the zones strongly affected by drought and the invasion of locust, levels of malnutrition and mortality recorded were higher than the international thresholds to which the situation is described as urgent.

A. Institutional framework

The QUIBB lies within the scope of the efforts made by the National Institute of the Statistics and the World Bank to provide indicators necessary for economic and social management.

The investigation was carried out by the National Institute of the Statistics, placed under supervision of the Ministry for the Economy and Finances. The project was managed by:

- The General Manager of the National Institute of the Statistics, Director of the project;
- A cell of coordination made up of a coordinator and two statisticians of investigations;
- A data-processing cell made up of a person in charge for treatment and two data processing specialists programmers;
- An administrative and financial service.

B. Sources of financing

The operation is entirely financed by the World Bank on the CWIQ Trust Fund and Belgian Trust Fund.

The pilot investigation and the various international consultations, inter alia, were financed on the CWIQ, directly managed by the World Bank. The envelope allocated with the investigation principal taken on the Belgian Trust Fund, is managed by the National Institute of the Statistics in accordance with the draft-agreement signed between the INS and the World Bank.

C. Dates of realization

- The pilot investigation was carried out from the 5 to April 9, 2004 and had as a principal objective to test the technical documents, the data-processing equipment of treatment and especially to initiate the executives of the National Institute of the Statistics to the new technology (optical character reading of the questionnaires) of the data processing. This investigation included 500 households, for both rural and urban.
- The principal investigation started with the staff training of collection and processing data. This formation lasted 3 weeks going from March 21 to April 09, 2005. The data-gathering on the ground began indeed on April 14, 2005 with 53 investigating agents, 14 controllers and two teams of supervision and ended on July 11, 2005, a three-month duration.
- The optical character reading of the data started on May 3, 2005. This operation consisted of scanning the questionnaires coming from the field and to carry out corrections before the validation. It was carried out at six computer networks. The validated questionnaires were sent to a central station held by two controllers and a data processing specialist. These activities ended on August 5, 2005.

1.2. Methodology

1.2.1 Objectives the aims of the QUIBB are:

- To quickly provide basic socio-economic data on the main part of the level gauges of life of the population (elimination of illiteracy, education, health, nutrition of the children of less than 5 years, use, housing, possession of durable goods, agricultural production and possession of cattle).
- To allow the follow-up and the evaluation of the policies, programmes and projects of reduction of poverty on the living conditions of the populations within the framework of the implementation of the Strategy of Reduction of Poverty (SRP) as well as the follow-up of the Objectives of the Millennium for Development (OMD).

The main part of collected information relates to the access, the use and the satisfaction of households compared to the principal social services and economic provided by the administration public, deprived or households.

1.2.2 Specific objectives the QUIBB has following specificities:

- simple Questionnaire: pre-coded questions easy to manage;
- very broad Sample: 335 primary units (zone of enumeration) and 6,700 minor units (households) in Niger;
- No manual data entry: optical character reading of the data using a scanner;
- decreased production time of the results: standard tables generated automatically by the software;
- report on the results very simple and;
- possibility of repeating the investigation annually;

- Possibility of associating new modules as it is the case in Niger.

1.3 The sample

The households which were actually surveyed quantify to 6,690 instead of 6,700 envisaged. This difference is due to the fact that in a whole zone of enumeration of the area of Agadez, only 10 households were found by the team of collection for reason of mobility of the nomadic population in this ZD. It is noted that on the 6,690 surveyed households, 254 and 365 households were replaced respectively because they refused to be interviewed and therefore not included in ZD of the area of Bilma and their population. Present in the household at the time of the investigation (either 10% of replacement) as table 1.3 shows below.

Table 1: Results of the investigation by area of residence

Regions	Households in the sample	Done with initially selected households	Households after refusal	Households refusal replacements	Not surveyed
