## I. CODEBOOK OVERVIEW

To aid the user, this codebook provides documentation for each variable in the four public use data files for BRIGHT II (codebook\_hh\_publicuse.dta; codebook\_ind\_publicuse.dta; codebook\_sar\_publicuse.dta; codebook\_sch\_publicuse.dta) including:

- Variable name: the variable name as it appears in the data file.
- Question text: the text of the question as it appears in the survey instrument.
- Universe: indicates which respondents were eligible to be asked the question.<sup>1</sup>
- N: total number of observations in the data file.

Numeric values and their labels are displayed for all categorical variables. For continuous variables, observations have been top/bottom coded<sup>2</sup> in keeping with Millennium Challenge Corporation's confidentiality guidelines and summary statistics such as means, minimum and maximum values, and standard deviations are displayed. These groupings maintain significant distinctions in the responses while protecting respondents' anonymity. Certain variables that contain information that could allow sample members to be identified were dropped from the datasets. An example of such a variable is HC5 (head of household's name). Variables used solely for the administration of the survey were also dropped. An example of a variable used solely for administration is HC17 (Interviewer/Supervisor Notes).

The dataset includes a personal identifier variable (PID), created by Mathematica staff, to provide a unique respondent identifier while keeping the identity of the respondent anonymous.

The data user should refer to the Interim Impact Evaluation of Burkina Faso's BRIGHT II Program: Household and School Survey User's Manual for information about study methodology.

---

<sup>1</sup> The universe for each variable was calculated by counting the number of respondents who should have been asked the question associated with that variable, not the number to whom it was actually posed. This may in some cases have created a Universe that is larger than the actual number of respondents for whom certain questions were posed. However, it allows for interviewer and data entry error and ensures that all possible respondents are included in universe calculations.

<sup>2</sup> "Top/bottom coding" means that responses that were very far above or below the norm were revised in the public data file to be closer to the rest of the responses, thereby making the respondent less identifiable to those who might recognize him or her from specific data. Specifically, for variables with potentially identifying information, responses in approximately the top or bottom 0.5 percent of the distribution were clustered to a single value.
