

# Madang 2011 EGRA Baseline Data Set

---

## Statistics

The Madang EGRA was conducted in 2011. It surveyed 1279 students in Grades 2, 3 and 4. It was conducted in English.

It also contains accompanying surveys from 23 teachers.

The data set was constructed from three survey instruments:

- the EGRA Madang survey
- the student context survey
- the teacher context survey
- the COS (Classroom Observational Snapshot) survey

## Format

A complete description of the data and variables is given in the accompanying data dictionary.

The dataset is broken down into several sections:

Preamble:

- this contains identifying information on student country, district, age, school and grade.

EGRA survey:

- this contains the information on survey responses for each of the eight sub-tests, including all individual item responses.

Student context survey:

- this contains the student responses to the survey and the language they responded in as noted by the enumerator. Please see the instrument for detail.

Teacher context survey:

- this was a separate survey distributed to teachers and later matched (with varying success) to student responses.

The COS survey is contained in a separate data set. It can be matched to the grade and school level, but not to the individual student.
