

Botswana STEPS Survey 2014

Tobacco Fact Sheet

The WHO STEPwise approach to surveillance (STEPS) is a simple, standardized method for collecting, analysing and disseminating data on noncommunicable diseases (NCDs) and risk factors. Data are collected on the established risk factors and NCD conditions that determine the major NCD burden, including tobacco use, harmful use of alcohol, unhealthy diet, insufficient physical activity, overweight and obesity, raised blood pressure, raised blood glucose, and abnormal blood lipids. Data from STEPS surveys can be used by countries to help monitor progress in meeting the global voluntary targets related to specific risk factors such as tobacco, alcohol, diet and physical inactivity. The tobacco indicators from STEPS can be used to evaluate and monitor existing tobacco-control policies and programs.*

The STEPS survey on NCD risk factors in Botswana was carried out from June 2014 to September 2014. The STEPS survey in Botswana was a population-based survey of adults aged 15-69. A multistage cluster sample design was used to produce representative data for that age range in Botswana. Survey information was collected electronically using handheld devices. The survey was implemented by the Ministry of Health. A total of 4047 adults participated in the Botswana STEPS survey. The overall response rate was 63%. A repeat survey is planned for 2020 if funds permit.
