Questionnaire:

English Questionnaire. some question(s) not included: V254 (how interested was respondent?)

Reason(s) not included: Because the survey was self-administered and V254 is for the interviewer.

V55 (Marital status) V56 (Number of children) V235 (Gender) V236 (age) V237 (age) V238

(education level) V241 (employment status) V256 (Race/ethnicity) Reason(s) not included:

Knowledge Networks has similar information currently on file for the panelists and appended those and other supplemental demographic variables to the data file.

Sample:

Sample was stratified by age (18-29, 20-44, 45-59, 60+), education (less than HS, HS, some college, Bachelors +), ethnicity (white non-hispanic, black non-hispanic, other non-hispanic, Hispanic, 2+ races non-hispanic), and gender The eight sources of deviation from epsem design are: 1 Half-sampling of telephone numbers for which we could not find an address, 2 RDD sampling rates proportional to the number of phone lines in the household, 3 Minor oversampling of Chicago and Los Angeles due to early pilot surveys in those two cities, 4 Short-term double-sampling the four largest states (CA, NY, FL, and TX) and central region states, 5 Under-sampling of households not covered

by MSN TV, 6 Oversampling of minority households (Black and Hispanic), 7 Oversampling of households with PC and Internet access 8 Selection of one adult per household.

Remarks about sampling:

Once Panel Members are recruited and profiled, they become eligible for selection for specific surveys. In most cases, the specific survey sample represents a simple random sample from the panel. The sample is drawn from eligible members using an implicitly stratified systematic sample design. Customized stratified random sampling based on profile data is also conducted, as required by specific studies. The primary sampling rule is not to assign more than one survey per week to members. In certain cases, a survey sample calls for pre-screening, that is, members are drawn from a sub-sample of the panel (e.g., females, Republicans). In such cases, care is taken to ensure that all subsequent survey sample drawn that week are selected in such a way as to result in a sample that is representative of the panel distributions.

Survey procedure:

Self-filled interview

Fieldwork:

For client-based surveys, a sample is drawn at random from active panel members who meet the screening criteria (if any) for the clients study. The typical sample size is between 200 and 2000 persons, depending on the purpose of the study. Once selected, members can be sent an advance letter by email several days prior to receiving the questionnaire through their WebTV appliance or personal computer to notify them of an important, upcoming survey. Once assigned to a survey, members receive a notification email on their WebTV or personal computer letting them know there is a new survey available for them to take. The email notification contains a button to start the survey. No login name or password is required. The field period depends on the clients needs, and can range anywhere from a few minutes to two weeks. Email reminders are sent to uncooperative panel members. If email does not generate a response, a phone reminder is initiated. The usual protocol is to wait at least three days and to permit a weekend to pass before calling. Knowledge Networks also operates an ongoing incentive program to encourage participation and create member loyalty. To assist panel members with their survey taking, each individual has a personalized home page that lists all the surveys that were assigned to that member and have yet to be completed. A few words about each feature: 1 Once the telephone numbers have been purged and screened, we address match as many of these numbers as possible. The success rate so far has been in the 70% range. The telephone numbers with addresses are sent a letter. The remaining, unmatched numbers are half-sampled in order to reduce costs. Based on previous research we suspect that the reduced field costs resulting from this allocation strategy will more than offset increases in the design effect due to the increased variance among the weights. We are currently quantifying these balancing features. 2 As part of the field data collection operation, we collect information on the number of separate phone lines in the selected households. We correspondingly down-weight households with multiple phone lines. 3 Two pilot surveys carried out in Chicago and Los Angeles increased the relative size of the sample from these two cities. The impact of this feature is disappearing as the panel grows. 4 Since

we anticipated additional surveying in the four largest states, we double-sampled these states during January-October 2000. Similarly, the central region states were over-sampled for a brief period. 5 Certain areas of the U.S. are not serviced by MSN®. We select a smaller sample of phone numbers in those areas and use other Internet Service Providers for Internet access of recruited households in those areas. 6 As of October 2001, we began oversampling minority households (Black and Hispanic) to increase panel capacity for those subgroups. 7 As of August 2002, we began oversampling households with PCs and Internet access to reduce the cost of WebTV set-up and maintenance. 8 Finally, for most of our surveys, we select panel members across the board, regardless of household affiliation. For some surveys, however, we select members in two stages: households in the first stage and one adult per household in the second stage. We correct for this feature by multiplying the probabilities of selection by $1/a_i$ where a_i represents the number of adults (18 and over) in the household.

Response rate:

Total number of starting names/addresses 1710 full productive interview 1201 partial productive interview 48 Response rate: 73,04% (1249/1710)

Remarks about non-response:

Knowledge Networks selected 1,710 members of its panel to participate in the survey. While 1,249 responded to the invitation to participate, forty-eight did not complete the entire self-administered Web survey. Because Knowledge Networks utilizes a panel methodology, we also report a separate panel recruitment response rate (AAPOR RR #3). This measure is the mean response rate for all panel recruitment cohorts from which these 1,710 panelists belong.

Weighting:

Whereas in principle the simple design is an equal probability design that is self-weighting, in fact there are several known deviations from this guiding principle. Furthermore, despite our efforts to correct for known sources of deviation from equal-probability design, there are several other sources of survey error that are an inherent part the process. We address these sources of survey error globally through the poststratification weights, which we describe below. The primary purpose of a post-stratification adjustment to survey weights is to reduce the sampling error for characteristics highly correlated with reliable demographic and geographic totals called population benchmarks. To implement post-stratification, we employed the following weighting techniques: 1. Calculate a base design weight for all sampled cases. 2. Modify this base design weight for the cases that completed the survey by calculating post-stratification weights against CPS population benchmarks for the adult age group. The raking variables are: age: 18-29, 30-44, 45-59, 60 and over gender: male, female race/ethnicity: white (non-Hispanic), black (non-Hispanic), other (non-Hispanic), Hispanic region: northeast, midwest, south, west education - highest level achieved: less than high school, high school, some college, college degree or more. In order to calculate final weights, we derive weighted sample distributions along various combinations of the above variables. Similar distributions are calculated using the most recent U.S. Census Bureau's Current Population Survey data and the Knowledge Networks panel data. Cell-by-cell adjustments over the various univariate and bivariate

distributions are calculated to make the weighted sample cells match those of the U.S. Census and the Knowledge Networks panel. This process, known as raking, is repeated iteratively until there is convergence between the weighted sample and benchmark distributions (CPS distributions). Occasionally, collapsing of post-stratification cells is necessary. This is dependent on the size of the sample and topology of the sample universe. Final post-stratification weights are provided. The final weights are censored at the extreme tails (1%, 99%). WEIGHT2 is scaled to the number of qualified completes cases (qflag=1).
