Sample:

1,002 adults (aged 18+) living in Trinidad and Tobago. The survey utilized a three (3) stage sampling

design. Stratification by size of Census enumeration District at Stage I . At the second stage, households within each ED are selected. At the last or third stage, individuals within each household were selected. This was done as follows: ED maps for the selected areas were marked with a start house (dwelling unit) and a sampling interval. A random walk was drawn on the map showing the exact route the interviewer must take. The interviewer was instructed to follow the route and to select every nth household. At the last or third stage, individuals within each household were selected. This was done so that the probability of selecting an individual within the household is the same for all eligible respondents. The last (most recent) birthday method was used to ensure this. In cases where the selected respondent is not at home, a total of three attempts were made to contact the person. Failing this, the household was substituted and a new person was selected using the same last birthday method.

Survey procedure:

Personal Face to Face Interview

Fieldwork:

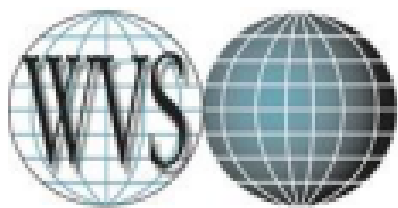

Original fieldwork was 14-09-06 to 08-10-06. However, checking of data revealed 2 interviewers had cheated on respondent selection so their surveys were discarded and replaced with new interviews conducted 03-11-06 to 08-11-06

Response rate:

1205 A - Total issued 12 B Not eligible (ill, dead, non-English speaking, not at this address) 1193 C - Total eligible 1002 D - Total questionnaires received 191 E - non-responses (including non-contact; see note above under sample type) 144 F - Refusals (including questionnaires less than half filled in) 47 G Non-contact (included in E)

Weighting:

Yes Rim weighting of overall results to reflect known population profile (derived from latest census and labour force surveys) to target variables: age, gender, work status, ethnicity and location
