PERU 2006

Geographical scope:

Peru

Principal investigator(s):

David Sulmont Haak Teresa Vania Martínez Jiménez

Data Collection Organization:

Instituto de Opinión Pública de la PUCP

Fieldwork Period:

07-12-2006 - 15-12-2006.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1500

Estimated Error:

+/-2.5%

Questionnaire:

Pilot Survey allowed to introduce some modifications to the questions, since the World Values Survey has a standard format that was necessary to follow. Nevertheless, information could be gathered during this stage, approximately in 1 hour to 1 hour and 15 minutes, which allowed to plan organize the fieldwork in terms of number of days and interviewers required for the different regions. Among the final questionnaire characteristics, we find two versions of the survey: A and B. Its aim is to proof the design effect in two different orders of the responses to these questions: "Of the following, what is the most important reason that influenced your decision to migrate? "" And second? " (see versions in annex) From version A 774 surveys were applied, and 726 from version B. In all regions only one of both formats has been applied, format A or B; except in Lima where one format has been applied to a 50% and the second format to the remaining 50%.

Sample:

The sample is designed to be representative of adults aged 18 and older, from all socioeconomic status, living permanently in the selected accommodations for the sample. The sample method involved a multi-stage clustered design: stratification by region, by urban and rural areas, and residence zones in Metropolitan Lima. -First stage: Selection of sample Spots Selection of urban blocks (manzanas) by a computer program. A cluster is defined as a block (manzana). Selection of 8 interviews per cluster/block In Lima and Callao, and 5 interview in the remaining urban areas. -

Second stage: Selection of Sample Households Within each selected sample block, households were selected through systematic sampling. Replacement of households and blocks was allowed in order to complete the interviews according to the cuota previously fixed. In rural areas, settlements with less than 200 dwellings were randomly selected. To select rural settlements for the sample, the field coordinator used a map and a list of settlements in order to exclude those towns or villages with access difficulty (more than 5 hour trip to access). Then the coordinator grouped the rural settlements in big axes around the large cities selected for the urban sample. Within each selected group, rural settlements were selected to apply from 5 to 10 interviews. The number of selected settlements depends on the number of interviews expected for rural areas, taking into account that the number of interviews for each settlement is from 5 to 10. Subsequently, households were chosen in each selected rural settlement by a random route method. In urban, as in rural areas, respondents were selected by age and sex quotas, which were fixed by the demographic distribution of the population.

Remarks about sampling:

With respect to the original sample design, the only variation was the application of an additional rural survey in Huancayo and one less in Huánuco. Due to the fieldwork schedule, it was decided to replace the survey in Huánuco by a survey in Junín, where the fieldwork was extended for a few days more.

Survey procedure:

Missing

Fieldwork:

100% of the interviews were spot-checked, or in lack of that, they were checked the next day. In the spot checking, not only the correct completion of the survey was verified, but also the right compliance of the selection method proposed (systematic selection of dwellings, age and sex quotas for the selection of respondents) which was registered in the zone sheets (hojas de zona) designed for that purpose. At this stage, we could correct errors, regain lost information and analyze the coherence of the collected data. Besides the spot-checking, a field supervision process was carried out. Days after the interview, the interviewers went back to the respondents house to verify that the information collected was truthful and authentic. At least 30% of the interviews were supervised, and at least one zone, randomly selected, of each one of the the interviewers.

Weighting:

Weighted by region, urban and rural areas. This weighting variable was included in the data-set.as the variable Peso, in order to correct for distortions in the representativeness of the sample according to the information of the 2005 Census.
