ITALY 2005

Geographical scope:
Italy

Principal investigator(s):

Prof. Dr. Renzo Gubert University of Trento via Verdi 26 38100 Trento Italy FAX: 3946-1881-299 E-mail: rgubert@gelso.unitn.it Gabriele Pollini

Email: gabriele.pollini@soc.unitn.it

Data Collection Organization:
Centro Ricerche Sociali (C.R.S) Milano (Italy)

Fieldwork Period:
10-05-2005 - 20-11-2005.

Universe:
National Population, Both sexes,18 and more years

Sample size:
1012

Questionnaire:
WVS question number or description of question: V80-v89; v100-v103; v152-v161; v170-v176; v231-v233. Reason(s) not included: It is a long questionnaire

Sample:
1) Classification of population by region, dimension of municipality (small. Medium, medium to large, large), geographical location (mountain or plain; cost or interior); 2) Selection of 80 municipalities, taking into account their characteristics as point 1); 3) Selection of a stratified sample of individuals within the 80 municipalities by systematic method; for large municipalities a preliminary chance selection of the electoral register was performed, stratified by location in center of the city, in the suburb and in the periphery. The stratification of the individuals sample was performed according to the nation-state strata dimensions. The population aged 18 to 74 was stratified by 20 regions, 2 genders and 3 age classes. In total the strata were 120.

Remarks about sampling:
The chance selection of the individuals by systematic method was performed in order to complete each of the 120 strata. No stratification by education was possible; therefore after the interview campaign we realized that the people with lower education were under-represented and people with higher education were over-represented.

Survey procedure:

Personal Face to Face Interview

Fieldwork:

Our aim in drawing up the sampling design for this national survey was to follow procedures which gave the best possible representativeness to the 1000 statistical units to be selected from the population aged between 18 and 74. To this end, we decided to adopt the following criteria: − reduce the number of sampling stages to the minimum; − stratify the reference population by means of discriminant values and certain values; − during the survey phase, reduce as much possible refusals by the subjects initially selected at random. As regards the stages, we discarded the idea of a preliminary sampling of regions and provinces, whose only purpose was to facilitate the survey by restricting it to a few areas of the country. From the point of view of statistical representativeness this would have meant introducing a sampling error already at this first level. In other words, the survey covered all the regions, with a quantity of interviews proportional to the population aged 18 to 74 in each region. In the first stage, we selected 80 municipalities taking account of the distribution of the Italian population not only by region but also by degree of urbanization (small, medium, medium-to-large, and large municipalities). We also sought to select these municipalities so as to replicate the socio-economic and cultural characteristics of the geographical macro-areas which divide Italy into North-East, North-West, Centre, South, and Islands. For this purpose we considered the location of a municipality (in a mountainous area or on the plain, on the coast or in the interior, in an area with good or poor communications), its socio-cultural characteristics, and its main economic activity. In the second stage we created a proportional stratified sample of the 80 samplepoints previously selected. The cases were extracted from the individual strata using the procedures of the systematic method, which involves calculation of a sampling interval in order to obtain a random sample. To be pointed out, however, is that there were three stages for large municipalities: before the subjects to be interviewed were extracted, we selected a number of electoral wards which adequately represented the various parts of the city. Generally selected were two wards in the centre, three in the suburbs, and two in the periphery. We calculated the size of the individual strata with reference to the entire Italian population aged 18 to 74, after this had been stratified by region (20 classes), gender (2 classes) and age (3 classes). These 120 classes represented the main benchmarks for the distribution of the statistical units. However, we sought to preserve stratification by size of municipality within each region as well. These devices connected with stratification are important for reducing sampling error because they counteract the negative effect of variance. It is well known, in fact, that sampling error is directly proportional to the amount of variance. In other words, if the variables used for the stratification are discriminatory and their values are known and certain, they should be reproduced in the sample consistently with the features of the universe. In this way their variance will not affect the sampling error. At the same time, all the other questionnaire variables significantly correlated with those used in the stratification of the population (gender, age, region, size of municipality of residence) will be more likely to furnish estimates which approximate the real datum. We now give details of the modes and outcomes of this stratification. To sum up, therefore, we may say that the variables used for the stratification enabled us to keep the extraction of the interviewees under control without affecting the randomness essential for statistical

representativeness. However, there was no guarantee that also the estimates of the other variables would closely approximate the reality. There are various factors that may alter the representativeness of a sample, above all the fact that some of the interviewees initially extracted, those whom we call effectives, must be substituted by reserves for various reasons. In order to reduce this risk as much as possible, we selected the reserves randomly from within the same stratum as the effectives. Moreover, by monitoring the work of the interviewers and giving them appropriate advice, we were able greatly to reduce the percentage of subjects who refused the face-to-face interview. We were helped in achieving this result by a letter previously sent to the persons extracted which explained the importance of the research and urging their collaboration. The result can be considered more than satisfactory, also because only a very small percentage of subjects refused to be interviewed (15.3%). These subjects, in fact, were those who could most easily have compromised statistical representativeness because the majority of them belonged to categories with shared social features. The effect is that of producing underestimations in that particular social group. This is less likely to happen with other types of substitution, because they tend to be distributed among all social categories without marked differences for specific groups in the population. However, even with this certainly positive outcome, the distortionary effect of substitutions cannot be entirely excluded, especially on certain characteristics of the real sample, which are favoured by other concurrent factors. We refer to the overestimation of graduates which occurs in almost all social or scientific surveys, because more highly-educated subjects more easily grasp the importance of this type of research, distinguishing it from numerous other surveys conducted for commercial or political purposes. Our survey, too, was subject to this kind of conditioning. One reason was that it was not possible to control for schooling through stratification because this information cannot be obtained from electoral registers, these being the usual sources for samples of the national population based on random extraction. Having pointed out these features, which on the one hand reassured us as to the procedures followed and the substantial equivalence between the theoretical sample and the real sample, but which on the other required caution because of the indubitable presence of overestimations and underestimations at the level of schooling, we complete the description with information about sampling error. To be stressed is that this aspect should be set in relation to the others considered, and not taken as absolute and indisputable information, because representative can only be regarded as certain for those variables where uniformity between the real population datum and the sample datum can be verified. The latter is only a preliminary estimate and its margin of error is always difficult to calculate. In this regard, we repeat what has already been said about substitution of effectives by reserves, while adding that the first sampling stage, the one relative to the selection of 80 municipalities, was carried out with reasoned choice. Consequently, we can only presume that the population resident in those samplepoints was representative of the Italian population as a whole. It is with this caveat that we calculate the sampling error. The formula used is the one applied when considering the percentage value estimated for a characteristic of the population and its opposite, i.e. the absence of that characteristics. This is therefore a formula that can be applied even when, as in our case, the variables are non-metric. $e = k \sqrt{pq/n}$ where (e) is the sampling error of the estimates, (k) the width of the confidence interval, to which is generally attributed the value of 1.96, i.e. 95 probabilities in 100 that the sample datum does not contain error

greater than that calculated; (p) is the proportion or percentage of occurrence of the feature for which the error is calculated; (q) the proportion in which that feature does not occur; and (n) the size of the sample. In this formula, the product (pq) substitutes the variance value, which is not calculable for non-metric variables. However, it is a value that corresponds to the degree of homogeneity/inhomogeneity regarding the proportion in which a particular feature revealed by the survey is present or absent. A feature is present with no inhomogeneity when one hundred per cent of the statistical units possess that feature. By contrast, there is maximum inhomogeneity when the feature is present or absent to a proportion of 50%. In this case, the product (pq) corresponds to 0.50x0.50, i.e. 0.25. If this proportion in the population is already known before the survey, its maximum value (0.25) is assumed when it is not ruled out that this value can be reached. Otherwise, reference is made to the datum furnished by the survey. For this research, if it is hypothesised that a feature may be present in 50% of the population, i.e. if the maximum value of the inhomogeneity index is considered, a sampling error of 3.1% is obtained. $e = 1,96 \sqrt{0,25/1000} = 0,31$ For features present with proportions above or below 50%, the sampling error is less than 3.1%: proportion (in 100) 50 and 50 30 and 70 10 and 90 error (%) 3.1 2.8 1.9

Response rate:
1000 Total number of starting names/addresses - addresses which could not be traced at all 17 - addresses established as empty, demolished or containing no private dwellings 22 - selected respondent too sick/incapacitated to participate 26 - selected respondent away during survey period - seleted respondent had inadequate understanding of language of survey - no contact at selected address 94 - no contact with selected person - refusal at selected address - proxy refusal (on behalf of selected respondent) 153 - personal refusal by selected respondent 31 - other type of unproductive (please write in full details in the box below) 657 - full productive interview - partial productive interview

Weighting:

Don´t know	2.2	1.8	2.6	1.6	2.1	2.6
(N)	(1,012)	(505)	(507)	(193)	(389)	(430)

V46.- Some people feel they have completely free choice and control over their lives, while other people feel that what they do has no real effect on what happens to them. Please use this scale where 1 means "no choice at all" and 10 means "a great deal of choice" to indicate how much freedom of choice and control you feel you have over the way your life turns out (code one number):

Italy 2005(N=1012)

Qualcuno pensa di poter decidere e scegliere liberamente come dovranno andare le cose nella propria vita. Altri ritengono invece che ciò che fanno non ha, in realtà, un grande effetto su come andranno le cose in futuro per loro. La prego di dirmi, usando questa scala, dove 1 significa "nessuna possibilità" e 10 significa "molte possibilitá", quanta possibilità di decisione e scelta Lei sente di avere su come andrà la Sua vita futura. (Una sola risposta)

	TOTAL	Sex		Age		
		Male	Female	Up to 29	30-49	50 and up

V94.- Now, I would like to read some statements and ask how much you agree or disagree with each of these statements. For these questions, a 1 means that you "completely disagree" and a 10 means that you "completely agree." (Code one number for each statement): We depend too much on science and not enough on faith.

Italy 2005(N=1012)

Usando la solita scala da 1 a 10, Le vorrei chiedere quanto Lei sia d'accordo o in disaccordo con le seguenti affermazioni, dove 1 significa che Lei é "completamente in disaccordo" e 10 che Lei è "completamente d'accordo"

Dipendiamo troppo dalla scienza e non abbastanza dalla fede.

	TOTAL	Sex		Age		
		Male	Female	Up to 29	30-49	50 and up
Completely disagree	7.5	8.5	6.5	9.8	8.5	5.6
2	5.2	5.3	5.1	4.7	5.7	5.1
3	6.6	7.3	5.9	9.3	5.9	6.0

V115.- Imagine two secretaries, of the same age, doing practically the same job. One finds out that the other earns considerably more than she does. The better paid secretary, however, is quicker, more efficient and more reliable at her job. In your opinion, is it fair or not fair that one secretary is paid more than the other? (Code one answer):

Italy 2005(N=1012)

È giusto che una segretaria più veloce, più affidabile, più efficiente, venga pagata di più di un'altra della stessa età che ha lo stesso compito?

	TOTAL	Sex		Age		
		Male	**Female**	**Up to 29**	**30-49**	**50 and up**
Fair	67.1	69.5	64.7	65.8	67.6	67.2

V179.- Some people believe that certain kinds of problems could be better handled by the United Nations or regional organizations rather than by each national government separately. Others think that these problems should be left entirely to the national governments. I'm going to mention some problems. For each one, would you tell me whether you think that policies in this area should be decided by the national governments, by regional organizations, or by the United Nations? (Read out and code one answer for each problem): Peacekeeping

Italy 2005(N=1012)

Alcune persone credono che certi problemi sarebbero trattati meglio dalle Nazioni Unite o da altre organizzazioni (macro)regionali come l'Unione Europea e la NATO, ad esempio, piuttosto che separatamente da ciascun governo nazionale. Altri ritengono che questi problemi vadano lasciati esclusivamente ai governi nazionali. Le citerò ora alcuni problemi. Potrebbe indicarmi, per ciascuno di essi, se Lei pensa che le politiche relative a queste cose dovrebbero essere decise dal governo nazionale, da organizzazioni (macro)regionali, o dalle Nazioni Unite?

Mantenimento della pace
