14. What were the different stages in your sampling procedure?  
**PLEASE WRITE IN:**

*We use probability sample that had been selected in multiple stages with proportional stratification. In the first stage, localities are chosen. In the second stage, the respondents were chosen from the localities with simple random sampling. In the first stage, locality strata have been created and the localities were chosen from these strata with the help of random sampling. All the regions (7) are involved into the sample. For each region 1 additional town and 2-3 villages are selected. In addition, the capital, Budapest is always included into the selected localities, because 20% of Hungarian population live there. About 70 localities are selected. Then, the number of respondents in the previously chosen localities has been defined in accordance with the proportion of the population of the given strata – regions, and different types of localities (towns and villages) within the regions. Thus, it is assured that each adult with an address in Hungary had equal probability to become a sample member.*

Yes ☒ → **ANSWER Q31a**  
No ☐

31a. Which one? Please specify

*Data is entered in SPSS Data Entry program. Logical control and exclusion of extreme values are always built in the program. This procedure reduces typing errors and other possible mistakes. Cleaning of data occurs at different stages. Before compiling the system file a program pre-checks for various types of coding error. Only after correcting these errors are the files joined.*

*For the weighting process, the expected social-demographic frequencies are determined by the latest relevant database of the Central Statistical Office, that currently is the National Census from 2001, to complete Microcensus 2005. The sample is weighted by considering the joint frequencies of four demographic factors:*

- 1. gender*
- 2. age group*
- 3. type of settlement and*
- 4. educational level.*

## Section 5: Characteristics of National Population

45. Each WVS member is asked to provide information on known characteristics of its national population, from census or the best available estimates from government surveys or other high-quality data-sources:

- sex distribution of the population
- age distribution of the population
- education (years of schooling) of the population
- other characteristics (PLEASE SPECIFY)

Please specify also the sources which have been used. Please note that the number of characteristics is what is minimal required. You can add as many characteristics as you like, but do not forget to specify them.
