STUDY TYPE
Other Household Survey [hh/oth]

SERIES INFORMATION
This is the first round of a series of mobile phone surveys

ABSTRACT
The survey draws on a probability sample of 1,297 adult Yemenis (18 years of age and older) with mobile phones, targeted across 21 governorates based on the latest population projections. Interviews were conducted over the phone in August and September 2022, using a questionnaire consisting of four sections mainly focusing on labor market experiences and food insecurity. Although the survey was implemented over the phone, it is expected to have adequate coverage of the target population, as mobile phone ownership was widespread in Yemen prior to the start of the conflict. According to the Household Budget survey of 2014, 81 percent of households owned a mobile phone. While there is no recent national level data on mobile phone ownership, representative data of areas under IRG control show that mobile phone ownership increased from 84 percent in 2014 to 92 percent in 2021 (Yemen Human Development Survey 2021). Additionally, a study comparing the number of mobile phones households owned in the World Food Programme (WFP) mobile Vulnerability Analysis and Mapping (mVAM) phone survey finds a similar number to that of the last nationally representative survey, the 2014 Household Budget Survey (HBS), except for some governorates where the number of mobile phones declined due to significant population migration.

Sampling

SAMPLING PROCEDURE
The survey used random digit dialing, relying on the range of valid numbers, with up to three attempts when a phone number was not reached—that is, the call unanswered, not picked up, picked up but unable to complete the interview at that time.

We used sample quotas were to obtain a diverse set of individuals across the governorates of Abyan, Aden, Al-Baida, Al-Dhale, Al-Hodeida, Al-Jawf, Al-Maharh, Al-Mahweet, Amran, Dhamar, Hadramout, Hajja, Ibb, Laheg, Mareb, Remah, Saadah, and Sanaa City.

DEVIATIONS FROM THE SAMPLE DESIGN
Some governorate quotas were not achieved due to small populations with mobile phones, lack of infrastructure for mobile phones, or blocking of international numbers for certain mobile phone service providers.

RESPONSE RATE
A total of 1,297 respondents completed the interview resulting in a response rate of around 28 percent, indicating the difficulty of completing phone interviews.

WEIGHTING
The individual-level selection probabilities were modeled as if based on a stratified sampling design, where the governorates serve as the strata; 2017 projected population counts at the governorate level were available and based on the 2004 census. Hence, an individual's selection probability was taken to be the ratio of the number of sampled individuals from the corresponding stratum and the projected governorate population size.

Household-level selection probabilities were modeled as if they were proportional to the household size, since any respondent residing in the corresponding household could have reported on household-level characteristics.

In some cases, sample respondents reported extremely large and unrealistic household sizes. As this may be due to observational error, the set of household size observations were Winsorized at the 90th percentile, which was found to be ten for these observations.

The selection probability for the sample respondents was taken to be proportional to the resulting observations.

For both the individual-level and household-level weights, we used a raking ratio calibration scheme to obtain the calibrated weights. We used the R programming language (R Core Team, 2016) with the aid of the "survey" package (Lumley, 2020, 2004) to calculate the calibrated weights.
