Sampling

SAMPLING PROCEDURE
The 2013 Chile GSHS was a school-based survey of students in grades 7°,8° basico and 1°- 4° medio, which are typically attended by students aged 13 - 17 years. A two-stage cluster sample design was used to produce data representative of all

students in grades 7°,8° basico and 1°- 4° medio in Chile. At the first stage,
schools were selected with probability proportional to enrollment size. At the second stage, classes were randomly selected and all students in selected classes were eligible to participate.

RESPONSE RATE
The school response rate was 90%, the student response rate was 67%, and the overall response rate was 60%.

WEIGHTING
The weighting formula used is:
W=W1 * W2 * f1 * f2 * f3.
The list below shows what each variable in the formula represents.
W1 - The inverse of the probability of selecting each school
W2 - The inverse of the probability of selecting each classroom
f1 - A school-level non response adjustment factor
f2 - A student-level non response adjustment factor calculated by classroom
f3 - A post stratification adjustment factor calculated by sex within grade
