## Sampling

### SAMPLING PROCEDURE

Stratified cluster sampling was used to produce representative data for that age range in Samoa.

Villages were stratified into 3 zones based on the Department of Health boundaries: Urban Apia, Rural Upolu and Savaii. Villages were randomly selected from each stratum using Probability Proportionate to Size (PPS) methods until the target population for each stratum was reached. This required 6 villages in Apia, 5 in Rural Upolu and 5 in Savaii.

### WEIGHTING

Analysis weights were calculated by taking the inverse of the probability of selection of each participant. These weights were adjusted for differences in the age-sex composition of the sample population as compared to the target population.

Different weight variables are available per Step:

wStep1 - for interview data

wStep2 - for physical measures

wStep3 - for biochemical measures

This allows for differences in the weight calculation for each Step of the survey as the age-sex composition of the respondents to each Step can differ slightly due to refusal or drop out.

## Data collection

### DATES OF DATA COLLECTION

Start	End
2002-08	2002-10

### DATA COLLECTION MODE

Face-to-face [f2f]

### DATA COLLECTION NOTES

Accu Chek Advantage Glucose Meter was used for glucose measurements.  
Accutrend GC was used for cholesterol measurements.
