Summary

The Global Adult Tobacco Survey (GATS), a component of Global Tobacco Surveillance System (GTSS), is a global standard for systematically monitoring adult tobacco use and tracking key tobacco control indicators. GATS is a nationally representative household survey of adults 15 years of age or older using a standard core questionnaire, sample design, and data collection and management procedures that were reviewed and approved by international experts. GATS is intended to enhance the capacity of countries to design, implement and evaluate tobacco control interventions.

GATS is designed to produce national and sub-national estimates among adults across countries. The target population includes all non-institutionalized men and women 15 years of age or older who consider the country to be their usual place of residence. All members of the target population are sampled from the household that is their usual place of residence. All GATS countries use country-specific stratified multi-stage cluster sampling designs and an interview consisting of a household screening component and an individual component administered to the selected respondent. Data are collected using electronic handheld devices.

GATS Panama was conducted in 2013 using a multistage stratified cluster sample design. The sample size was 19,603 selected households with 16,962 completed individual interviews. The GATS Panama questionnaire included core questions about background characteristics, tobacco smoking, smokeless tobacco, cessation, secondhand smoke, economics, media, and knowledge, attitudes and perceptions. Questions were adapted in each section, then reviewed and approved by a questionnaire expert review committee. The questionnaire was administered using a software program developed by RTI International for electronic data collection using handheld computers.

Personally-identifying information has been removed from this data file to protect confidentiality. Due to the complex sample design, clustering, stratification and sample weights should be taken into account in data analysis in order to obtain proper point estimates and variances. The stratification, cluster and sample weight variables are gatsstrata, gatscluster and gatsweight, respectively. The method we have described to you costs [READ AMOUNT FROM BELOW], remember that with this method you could stop smoking for at least 10 years. At that price, would you be willing to pay for the method?

NOTE: The monetary amount was randomly selected from a distribution of amounts in the chosen range between $25 and $1,000 (maxbuyvalues = 25; 50; 75; 100; 200; 300; 400; 500; 600; 700; 800; 900; 1000). Once the respondent answered the question, a negotiation process was initiated to obtain the maximum willingness to pay for the method.

If the response was yes, a higher amount was asked. If the response was no, a lower amount was asked. (The amounts changed in a geometric manner, multiplying or dividing by two.) This continued until a maximum value was obtained.

The data for this question are recorded as two items in the following format "xx|YYYY|" where xx is the 0 based index of the item in the list that started the max buy iteration (1 to 13, corresponding to the maxbuyvalues) and YYYY is the final amount agreed upon.
