Afrobarometer Round 10 Survey in
Gambia

Prepared by Jamy Felton, May 2025

Technical information form

| | |
|------------------------------|---|
| Universe: | Citizens of Gambia who are 18 years and older |
| Sample design: | Nationally representative, random, clustered, stratified, multi-stage area probability sample |
| Stratification: | Region and urban-rural location |
| Stages: | Primary sampling units (PSUs) (from strata), start points, households, respondents |
| PSU selection: | Probability proportionate to population size (PPPS) |
| Cluster size: | 8 households per PSU |
| Household selection: | Randomly selected start points, followed by walk pattern using 5/10 interval |
| Respondent selection: | Gender quota filled by alternating interviews between men and women; respondents of appropriate gender listed, after which computer randomly selects individual |
| Weighting: | Weighted to account for individual selection probabilities |
| Margin of error: | +/-3 percentage points at 95% confidence level |
| Fieldwork by: | Center for Research and Policy Development |
| Survey languages: | English, Mandinka, Wolof, Jola, and Fula |
| Main researchers: | Sait Matty Jaw, Fatou Jagne, Luqman Saka |
| Outcome rates: | Contact rate: 97.0% Cooperation rate: 81.4% Refusal rate: 8.4% Response rate: 79.0% |
| Dates of fieldwork: | 29 April-17 May 2024 |
| Sample size: | 1,200 |
| Sampling frame: | 2013 Gambia Population and Housing Census |
| EA substitution rate: | 0.7% |

About

Afrobarometer (AB) is a pan-African, non-partisan survey research network that conducts public attitude surveys on democracy, governance, the economy, and society. We are the world's leading source of high-quality data on what Africans are thinking.

Our vision is "A world in which Africa's development is anchored in the realities and aspirations of its people".

AB is a non-profit company limited by guarantee with headquarters in Accra, Ghana.

Data Weights

Afrobarometer includes four weights in our datasets. Two weights are used in all country-level datasets, and an additional two weights are used in our multi-country, merge datasets for each round. The **withinwt_ea** and **withinwt_hh** weights correct for over-and under-sampling at the national level. Each respondent is assigned a weight based on the inverse of their probability of selection, accounting for factors like geographical region and urban-rural distribution. The difference between the two withinwt variables is that while **withinwt_ea** accounts for enumeration population size, **withinwt_hh** factors in enumeration population AND household size, and is not available for earlier rounds of the survey.

In each merge dataset, we have two additional weight variables, **combinwt_ea** and **combinwt_hh**. These weight variables are based on the **withinwt_ea** and **withinwt_hh** variables, but they also standardise all national samples in the merge dataset so that each country has equal weight in the continental average.

In general, a weighting variable should be used when reporting national (**withinwt_ea** or **withinwt_hh**) or cross-national (**combinwt_ea** or **combinwt_hh**) results to ensure accuracy and reliability when making generalisations or drawing conclusions at the national level or multi-country level.

NOCALL Variables (Unit non-response)

In Afrobarometer surveys, interviewers record unsuccessful household calls as a “NOCALL”. Reasons for unsuccessful calls may include (but are not limited to) refusals to interview by the selected respondent or household members, absence of the randomly selected respondent, or respondents not meeting the selection criteria (citizens over the age of 18 who speak one of the survey languages). These NOCALLs are recorded as variables embedded in each successful case. If interviewers have five unsuccessful calls before a successful interview, users will find that NOCALL1 to NOCALL5 contain the reasons for the unsuccessful calls before the successful interview.

Non-response coding

Afrobarometer utilises a standardised set of non-response codes across all questions and surveys. They are as follows:

- Missing=-1 (no “system missing” data or empty cells)
- Don’t know= 9, 99, 999 or 9999
- Refused to answer=8, 98, 9998 or 9998
- Not Applicable=7, 97, 997 or 9997
- No Further Response/Answer=96, 996 or 9996
- Not asked in country=9994

Computed variables:

AB data sets include three computed variables that are Afrobarometer’s signature indicators of Lived Poverty, Demand for Democracy, and Supply of Democracy, each of which is described below.

Lived Poverty Index (LPI):

“As a contribution to the tracking of poverty in Africa, Afrobarometer offers the Lived Poverty Index (LPI), an experiential measure that is based on a series of survey questions about how frequently people actually go without basic necessities during the course of a year. The LPI measures a portion of the concept of poverty that is not captured well by other measures, and thus offers an important complement to official statistics on poverty and development (Mattes, 2008)”¹.

The LPI is computed both as a raw average of the frequency with which respondents go without five basic necessities (Q7A-E), and as a categorial variable that groups respondents as experiencing no, low, moderate or high lived poverty.

The following syntax is used to generate these two variables (in .sps format).

Demand for Democracy (DemandDemo):

DemandDemo' is a long-standing Afrobarometer indicator that combines explicit support for democracy (Q22) with rejection of all three non-democratic alternatives (Q21) – one-party rule, military rule, and strongman/one-man rule – using the following syntax:

```

Supply of Democracy (SupplyDemo):

SupplyDemo combines the indicators of perceived extent of democracy (Q32) and satisfaction with the way democracy works (Q33) to provide a single indicator of the extent to which governments are supplying democracy to their citizens. The syntax is as follows:

RECODE

```

Limitations of Afrobarometer Data

Afrobarometer uses national probability sampling designed to generate a sample that is a representative cross-section of all citizens aged 18 and above. Samples usually include either 1,200 or 2,400 cases. A randomly selected sample of n=1,200 cases allows inferences to national adult populations with a margin of sampling error of +/-2.8 percentage points with a confidence level of 95%. With a sample size of n=2,400, the margin of error decreases to +/-2.0 percentage points at a 95% confidence level. The margins of error will increase for sub-national groups (regions, demographic groups, etc.). While efforts are made to minimize nonresponse, some biases may exist if certain groups are underrepresented in the final sample.
