

CHAPTER V

AREA AND PRODUCTION OF CROPS AND CROP UTILIZATION

1 INTRODUCTION

Ethiopian farming largely produces only enough food for the peasant holder and his family for consumption, leaving little to sell. This inadequate volume of production is ascribed to the tardy progress in the farming methods and scattered pieces of land holdings. Under this traditional sector, agriculture is practiced on public land and most of the produce is mainly for own consumption. The diverse climate of the country and the multiple utilizations of crops have prompted the vast majority of agricultural holders to grow various temporary and permanent crops. Despite the variation in the volume of production, the relative importance and pattern of growth of these crops are largely similar across many of the regions. This similarity is well observed and demonstrated in the statistical tables presented in this report. In some regions there seems to be a shift in choice of crops grown. In the Afar Region* Teff, barley and wheat do not figure prominently. Instead in this region maize and sorghum are grown in greater volume.

There is a general agreement that the performance of an agricultural system should achieve a steady supply of food to the people of a country. But, unless special attention is focused on agriculture, its performance can be impeded by vagaries of nature, population growth and scarcity and fragmentation of land, thus, affecting food supply and posing a challenge to the federal and regional

* It should be noted that the data collection refers only to Dubti, Asayita and Afambo weredas of Zone 1, Amibara, and Awash Fentale weredas of Zone 2 and Argoba Special Wereda of Zone 3 in Afar Region .

governments. This situation calls for an overhaul of the agricultural system in the country or the regions.

In order to have a flourishing agriculture, which sustains reliable food supply, the federal and regional governments have to formulate and implement farm programs that ensure food security. The preparation, execution, monitoring and assessment of these programs entail statistics on agriculture particularly crop production since it is the prime target that national or regional agricultural policies aim at.

The collection of data on crop production should encompass all crop seasons in the agricultural calendar and farming activities in both rural and urban areas. It should also include the wide range of crops that are grown and embodied in the food security system, which are indispensable for a sustained provision of staple diet and other cash crops like coffee and Chat.

In view of this, crop production data for private peasant holdings for both Meher and Belg seasons in both rural and urban areas were collected in the census to provide the basis for decision making in the process of implementing timely food security measures and to make policy makers aware of the food situation in the country.

Thus, in this chapter the census data on production of temporary crops/annual crops such as cereals, pulses, oilseeds, vegetables and root crops are presented in Section 2. Also production of permanent crops that included fruit crops, stimulant crops and other permanent crops are dealt with in Section 3. Moreover, the utilization of temporary crops as well as permanent crops for various purposes such as household consumption, seed, sale, paying wages in kind ...etc are indicated in Section 4. Also these census data should also be presented at zonal and woreda levels.

Hence, statistical tables providing these data for the weredas and zones covered in the region are given at the end of this chapter. Moreover, Standard Errors (S.E) and Coefficient of Variation (C.V) for selected variables are given as an annex to this chapter.

2. PRODUCTION OF TEMPORARY / ANNUAL CROPS

The types of temporary crops on which data were collected during the census are those that food security embraces: that is, the crops that are the staple diets in the country. In the statistical tables, these crops have been categorized into five groups for simplicity of description and comparison purposes. The groups are cereals, pulses, oilseeds, vegetables and root crops. The crops within each group have some similarity, which made the categorization necessary.

2.1 Cereals

These are crops that are produced in greater volume compared to the other crops because these are the principal staple crops every year and export commodities at times of bumper harvest in the country. Between the months of September 2001 and August 2002 it was learned that 242,794 quintals of cereals worth 106,028,521 Birr was exported from Ethiopia to various countries. (CSA External Trade Statistics). Cereals are grown in almost all regions of Ethiopia with notable variation in the extent of areas planted and the volume of production obtained. This variation is seemingly caused by a shift in choice of crops by the holders and difference in weather conditions. Summary Tables V.1 and V.2 reinforce this thought further by giving a highlight on the size of area planted to maize, sorghum and godere and

volume of production of these crops harvested in the Afar Region* when compared to Teff, barley and wheat produced.

Summary Tables V-1 and V-2 show that 96.97% of the regional grain crop area was devoted to cereals and 98.61% of the grain production was that of cereals. The data shows that out of the total area under grain, maize and sorghum took up 73.31% and 14.33% and the yield was 79.47% and 14.15% of the total regional grain production, respectively. The area planted to grains and the production acquired in Belg season were 7.82% and 0.14% of the total grain crop area and grain production of the region, respectively. Of the regional area under cereals, 7.52% was cropped in Belg season and 0.09% of the cereal production is achieved in the same season.

As the census result depicts, agricultural households in urban areas of the region contributed 5.18% and 1.19% of the regional grain crop area and grain production, respectively. The data also indicates that of the total area under cereals and cereal production, 5.34 % and 1.21 % were added by urban agricultural households, in that order.

A look at the zonal tables helps to note that Zone 1 and Zone 3 shared 55.54% and 44.46% of the total regional crop area, respectively. The zonal contributions to the regional production were 42.18%, and 57.82% for Zone 1 and Zone 3 in the same order. The zones made up 58.82% and 41.18% of the regional area under grain crops and 65.60% and 34.40% of the regional grain production, in the that order. The data in Summary Tables V-3 and V-4 indicate that 99.44% of the zonal grain crop area was under cereals and 99.67% of the production was made up of the same crops in zone 1. Maize,

* It should be noted that the data collection refers only to Dubti, Asayita and Afambo weredas of Zone 1 , Amibara, and Awash Fentale weredas of Zone 2 and Argoba Special Wereda of Zone 3 in Afar Region .

that accounted for 98% of the area under grains, was the major crop in the zone. The major crop maize, contributes 98.04% of the zonal grain crop production.

Summary Tables V-5 and V-6 show that 93.44% of the grain crop area was under cereals and 96.58% of the grain production was drawn from these crops in Zone 3. Maize and Sorghum were the major cereal crops in the zone accounting for 38.07% and 33.2% of the zonal area under grain crops and 44.05% and 38.03 of the zonal grain production, respectively.

2.2 Pulses

Pulses are essential part of the dietary requirements for most Ethiopians. These crops also form a significant commodity group of export, earning a considerable amount of foreign exchange for the country and cash for peasant farmers. In 2001/02 (1994 E.C.) between the months of September and August, 1,229,366 quintals of pulses valued at 351,997,759 Birr was exported from Ethiopia to various countries. (CSA, External Trade Statistics). These are some of the grounds for growing various pulses in all regions of the country with varying quantities. There is no doubt that economic benefits can accrue to the country from the production and export of more pulses if the agriculture in Ethiopia is given due attention in this regard.

A view of Summary Tables V-1 and V-2 enables to detect that only 1.58% of the regional grain crop area was under pulses and 0.43% of the grain production consisted of the same crops. Of the regional area under grain crops, 0.84% was planted to chick peas. The production obtained from haricot beans was only 0.23% fo the regional grain total.

In Zone 3, 1.43% and 1.52% of the regional and the grain crop area was under pulses and 0.27% and 0.43% of the zonal total and grain production was drawn from these crops accordingly.

2.3 Oilseeds

These crops are also of paramount importance as a source of cooking oil used to provide the fat required in the food consumed by the residents in the region. Moreover, oil crops have become a major commodity of export earning a great deal of foreign exchange. Between September 2001 and August 2002, Ethiopia exported 953,088 quintals of oilseeds valued at 351,952,634 Birr signaling that an increase in the production and export of these crops will definitely generate more money. (CSA, External Trade Statistics).

Summary Tables V-1 and V-2 indicate that only 1.45% of the regional grain crop area was under oilseeds and 0.97% of the regional grain production was that of the oil seeds.

Summary Tables V-3 and V-4 indicate that in Zone 1 oilseeds contributed 0.27% and 0.22% of the area and production under grain crops of the region, respectively.

2.4 Vegetables

These crops like fruits are also a good source of nourishment necessary for the healthy growth of humans. Dieticians often advise people to eat more of vegetables for their nutritional values. Vegetables are relatively cheaper and better available than other farm products in urban centers because these crops are usually grown as garden produces sometimes using irrigation. It may be worth to know that a certain amount of foreign exchange is drawn from vegetable exports. For instance between September 2001 - August 2002

Ethiopia exported 61,070 quintals of vegetables worth 11,543,144 Birr to various countries. (CSA, External Trade Statistics). Thus, on the grounds that vegetables are nutritionally and economically important, it is worth expanding vegetable farming.

Summary Tables V-1 and V-2 show that only 2.29 % of the regional crop area is under vegetables which formed 8.67 % of the total volume of production in the region. Tomatoes took up 90.75 % of the regional vegetable area and the same crop made up 97.6 % of the vegetable production of the region.

Summary Tables V-5 and V-6 show that Zone 3 formed 99.40% of the regional area under vegetables and 99.95% of the regional vegetable production, in that order. In Zone 3 tomatoes covered 90.75% and 97.60% of the zonal area and production under vegetables accordingly.

2.5 Root Crops

Some root crops like onion and garlic are indispensable part of the daily meal of the Ethiopian population. These crops are essential to improve the taste and scent of the food. Potato, which is one of nature's precious gifts, is also very common in the dishes of most Ethiopians. This importance necessitated the growth and production of many of the root crops throughout the year often via the use of irrigation. Root crops are also a good source of cash and foreign exchange for the growers and the country, respectively.

In 2001/02 (1994 E.C), the country has acquired a sum of 22,423,972 million Birr by exporting 120,497 quintals of root crops. (CSA, External Trade Statistics). The economic and nutritional importance of root crops has been a factor for practicing the agriculture in all the regions and growing the crops more than one time in a year.

Summary Tables V-1 and V-2 indicate the root crop situation in Afar Region. As the tables show, root crops covered only 3.31 % of the regional crop area and 27.04 % of the production volume. Onion shared 98.83 % of the regional root crop area and these crops added 99.58% to the regional volume of root crop production, respectively.

Area Under Temporary Crops for Private Peasant Holdings

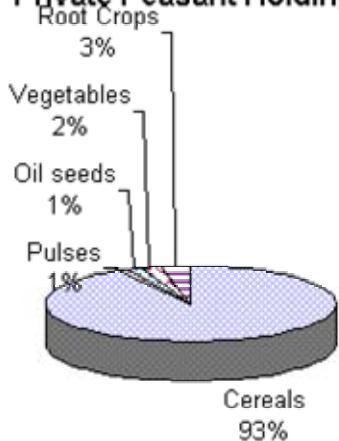

Figure V-2 Production Of Temporary Crops for Private Peasant Holdings

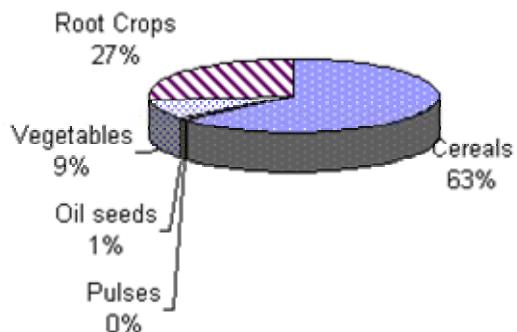

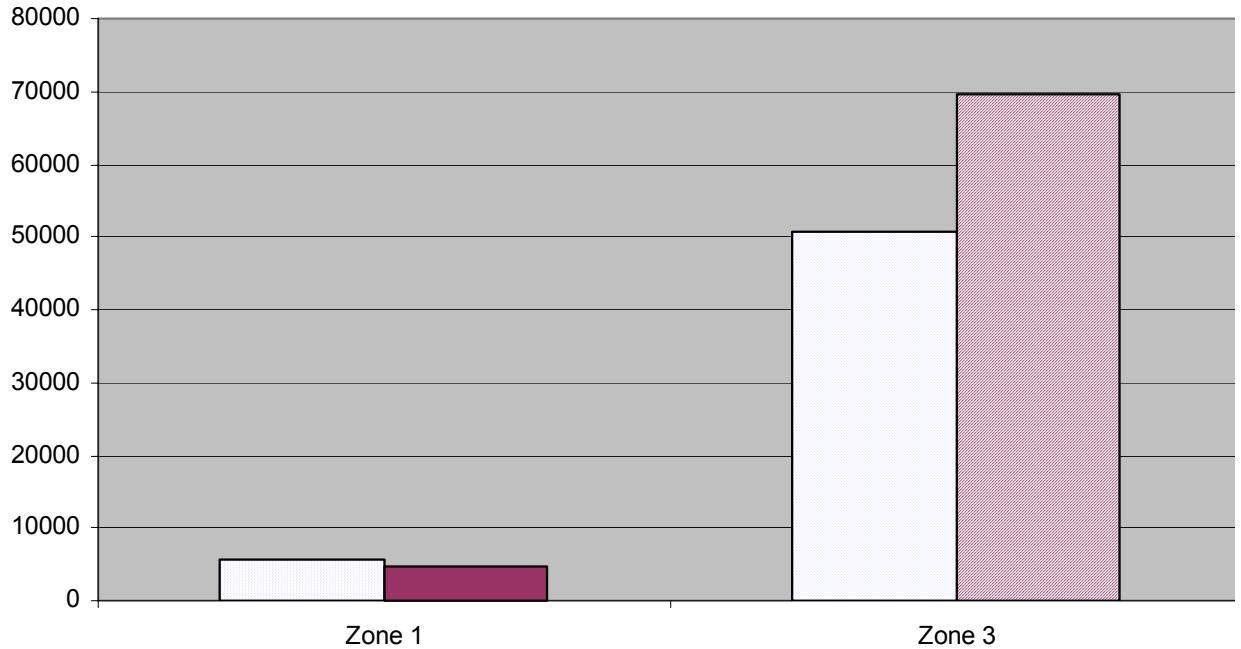

Figure V-3 Area and Production Of Temporary Crops For Private Peasant Holdings at Zc level

3. PRODUCTION OF PERMANENT CROPS

Permanent crops are long term crops that occupy the field planted for a long period of time and largely harvested every year and do not have to be replanted for several years after each harvest. These include tree crops such as coffee, Enset, Chat, oranges, mangoes, bananas, papayas, avocados... etc. The trees that yield fruits like oranges, mangoes, papayas, apples and others are also known as fruit trees.

Permanent crops are a good source of cash both for the holders and the country generating handsome income and foreign exchange at the best of times. For instance, between September 2001 and August 2002 Ethiopia

exported 53,142 quintals of fruits and nuts and 91,705 quintals of Chat valued at 16.5 and 426.7 million Birr, respectively. (CSA, External Trade Statistics). With these bits of information and the dietary and economic importance of the crops in mind, it is not difficult to project the profits that can be reaped from the permanent crops if the farming in this regard is well developed and managed.

Fruits are not only a source of cash but are also a reliable source of nutrition that is essential for the health and growth of humans. There has even been an oft-repeated advice from health authorities that we should include fruits in our daily dish to make it nutritious. The two points made on the importance of permanent crops underscore the fact that fruit farming should be encouraged and expanded to have a steady supply of the desired products.

It is possible to conjecture that permanent crops in Ethiopia are not as well developed as they are in other countries. But the potential to develop them is great as Ethiopia is blessed with diverse climate conducive to the crops. In order to direct efforts towards the development of permanent crops, one requires statistical data regarding this sector of the agriculture. Adequate data on type and volume of production, area under permanent crops and their distribution have not been available. Hence, to bridge up this gap and alleviate the chagrin to data users the CSA has collected data on permanent crops.

Prior to the census, the CSA surveyed the situation about permanent crops in the country and then decided on the types of permanent crops, range of data items and method of enumeration to be included in the census. Hence, only major permanent crops were covered during the census. Data on the types of crops were collected by holder interview while area and yield data were recorded by objective measurements. The numbers of Enset, Hops (Gesho) and fruit trees with the exception of pineapple were determined by counting the plants excluding seedlings.

In estimating the production of permanent crops, area, yield per unit area, yield per tree and number of fruit bearing trees are essential ingredients. These inputs were determined by physically measuring the area under crops in question, picking fruits, coffee berries and Chat produce from randomly demarcated plots or selected trees. The method involved crop cutting from small plots of rectangular shape of different sizes randomly placed in the selected crop field and a tree of fruit bearing age selected from all fruit bearing trees for each crop type and subsequent husking, drying weighing and recording the weight of the harvest of permanent crops. The crop cutting was performed for a sub sample of 20 households of the 30 households selected in each enumeration area. A 4m X 4m plot was demarcated for coffee and Chat and a 2m X 2m for pineapple and 1m X 1m plot for sugar cane were designated for the crop cutting exercise. The yields harvested from these plots and trees were immediately weighed (green weight) and/or weighed again after two weeks of drying to conform to the normal holder harvesting and drying practices. The coffee weight registered was that of clean coffee beans and the hops (Gesho) weight taken was that of the dry one. The green and dry weights were recorded on the appropriate forms.

For simplicity of description of the statistical tables and comparison purposes permanent crops have been grouped into three categories. Each category has a semblance of similarity, which necessitated the categorization. The categories are fruit crops, stimulant crops and other permanent crops. These categories include only permanent crops on which yield data have been collected.

3.1. Stimulant Crops

This category embraces cash crops like coffee and Chat, which are extensively grown in many parts of the country. It is needless work to verify by quoting statistical evidences that coffee is a major foreign exchange earner. It may not

be even surprising to hear that Chat farming is becoming a rapidly expanding phenomenon in Ethiopia because of its economic importance. Summary Table V-7 shows the situation in which stimulant crop are found in Afar Region. The data in the table demonstrates that 7.41% and 54.27% of the area was covered by coffee and hops/gesho.

3.2 Other Permanent Crops

This group includes Enset and Sugar cane on which yield data have been collected. Enset is a principal staple crop extensively grown in S.N.N.P. and Oromiya Regions. The growers draw a substantial amount of money from the sale of Enset products. Though, sugar cane is an industrial crop it looks that it is not widely practiced by the private peasant holders, as the statistics seem to indicate. It is produced on a small scale by private peasant holders in some pockets of the country and usually does not end up in sugar cane processing plants. The sugar factories in Ethiopia run extensive Sugar cane plantations. As the statistics indicate 660,146 quintals of sugar worth 111,773,918 birr was exported between September 2001 and August 2002. (CSA, External Trade Statistics).

Summary Table V-7 sheds some light on the production of Sugar cane in Afar Region. The crops covered a nonsignificant area.

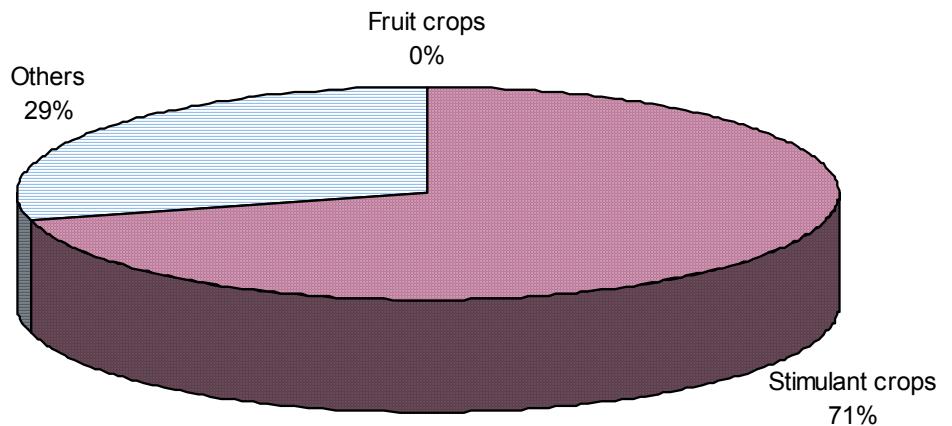

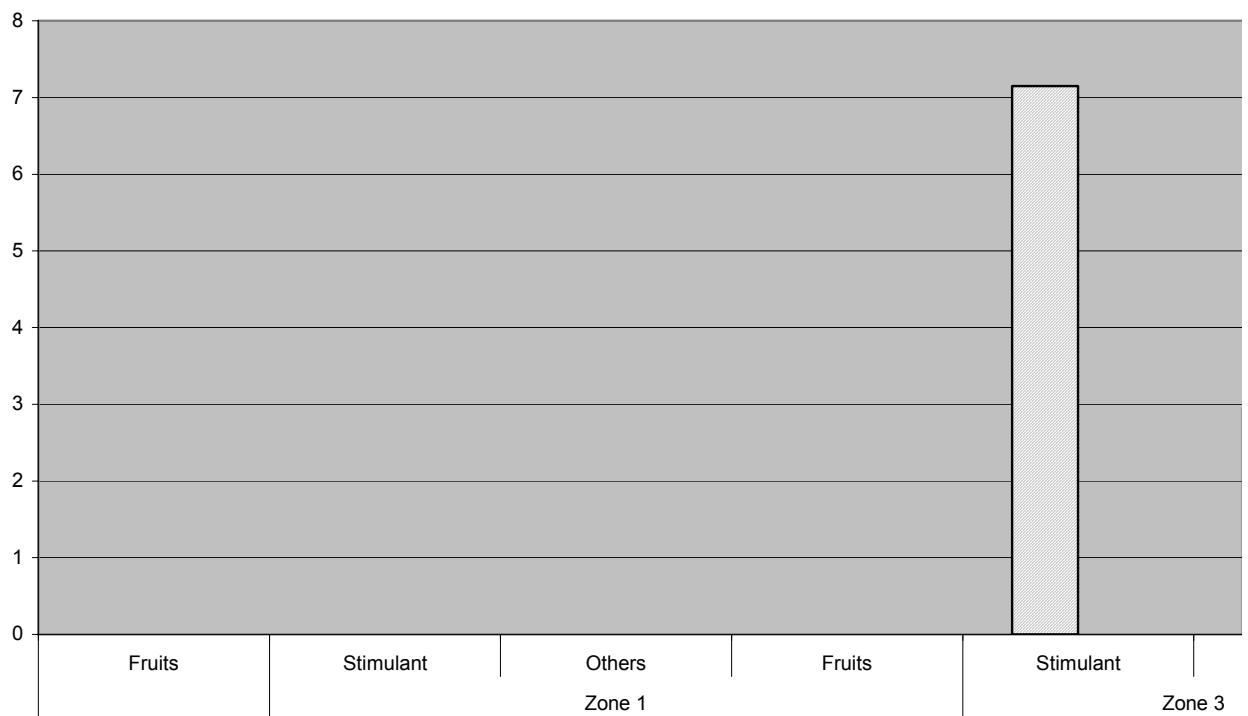

Figure V-5 Area Of Permanent Crops

4. Crop Utilization

Agriculture is the livelihood of the overwhelming majority of the Ethiopians. It is the source of food and cash for those who are engaged in it and others. Most agricultural holders acquire the food they eat and the cash they need to cover other expenses only from farming activities. Since farming in Ethiopia is often precarious and usually at the mercy of nature, it is invariably an arduous struggle for the holders to make ends meet. This, it often transpires, is true to the frequent shortfalls in the volume of production that occur in the country.

It is often said that what most Ethiopian agricultural holders produce is only enough to live, hand to mouth. This would be better said if it was statistically substantiated. There is plenty of information on the volume of crops produced

within the private peasant holdings. But there is hardly any information on how the peasants utilize the crops they produce which will be indicative of the fact whether the holders have enough or little to sell in order to meet other expenses for living. For use in the census taking, crop utilization was defined as the amount of agricultural produce used for own consumption, sale, seed, and wages in kind, animal feed and other purposes.

In light of this information gap, the CSA has collected some data on how holders use their agricultural produce in the agricultural year to provide some information on the subject. The data were collected by interviewing the holders. They were asked to quantify their yearly crop utilization experience in percent based on common practice. Summary Tables V-10 to V-12 convey this information to shed some light on how holders utilize their crop produce. Information was sought for each crop type produced during the census year. The resulting data may help users to have some idea about crop usages by agricultural holders. In order to detect the differences in utilization of the various crops, it is better to look into the data by group of crops as categorized in the summary tables for simplicity and analogy.

In Afar Region about 54% of the cereals produced were used for household consumption. About 28 % and 15 % were used for sale and seed, respectively. The remaining 3 % of the cereals produced was used for other purposes like paying wages, animal feed, etc. When the utilization is considered by crop type, it is easy to realize that between 54% and 80% of the crops in the cereals group were used for own consumption and between 1% and 29% of these crops were used for sale. Moreover, between 6% and 21% of the same crops in the same group were used for seed.

As shown in Summary Table V-10 the data reveal that more than 78% of pulses were used for household consumption, 8% were used for sale and 14% for seed. Considering utilization by crop type within the pulses group,

between 7% and 100% of the crops were utilized for household consumption and between 2% and 61% of the same crops in the same group were sold in 2001/02 (1994 E.C.). Moreover, between 8% and 32% of these crops in the pulses group were also used for seed in the same year.

Moreover, about 64%, 29% and 4% of the oilseeds were used for household consumption, for sale and for seed purposes, respectively. Taking utilization by crop type into account, between 35% and 100% of each crop type in the oilseeds category were used for household consumption, between 11%-50% for sale and between 4% - 15% for seed. It may reasonably be summed up that more of the oilseeds produced are used for household consumption.

About 11% and 81% of the vegetables produced were used for household consumption and sale, respectively. The remaining percent were used for seed, wages, animal feed and others. The percent used by crop type with in the vegetables group were between 9% - 96% for household consumption, between 1% - 86% for sale, between and 2% - 5% were used for seed. For details, refer to Summary Table V-10.

The utilization of root crop production has the same pattern with vegetables as indicated in the Summary Table V-10. Thus about 9 % of the root crops were used for household

Consumption, 84% used for sale and 1% for seed. The ranges of percent utilized by crop type within the root crops category fall between 8% - 22% for consumption, 16% - 87% for sale and 1% - 5% for seed.

In Zone 1, the percent of cereals used were 53% for household consumption, 29% for sale and 16% for seed. Crop utilization in the zone for each crop in the cereal category ranged between 53% and 87% for household consumption, 29% for sale and 14% - 16% for seed.

About 9% of the oilseeds grown in the zone were used for consumption at home, 77% for sale and 8% for seed. The usage of oilseeds by crop type within the category for household consumption, 77% for sale and 8% for seed.

The census result reveals that in Zone 3 about 79% of cereals were used for household consumption, 9% for sale and about 9% for seed. The percent of utilization of each crop in the cereal category ranged between 64% and 85% for household consumption, 1% - 21% for sale and 5% - 16% for seed.

Concerning pulses about 78% of the pulses were used for household consumption, 8% for sale and 14% for seed. The percent of utilization by crop type within the pulses category were between 7% - 100% for household consumption, between 2% - 61% for sale and between 8% - 32% for seed.

As shown in Summary Table V-12, about 67% of the oil seeds were consumed 27% for sale and 4% for seed. The percent utilized by crop type within the oil seed category fall between 35% - 100% for 11% - 50% for sale and 4%-15% for seed.

As mentioned earlier data on the pattern of crop utilization of vegetables and root crops was collected. The result shows that about 11% of the vegetables grown were used for household consumption and 81% for sale and 3% for seed. The percent utilized by crop type in the vegetable category varied from 35% - 100% for household consumption and 1% - 86% for sale and between 2% - 5% for seed in Zone 3.

In Zone 3 the data show that about 9% of the root crops were used for household consumption and 1% for seed and 84% for sale. The percent utilized by crop type within the group fluctuated from 8% - 22% for household consumption and 1% - 5% for seed and 16% - 87% for sale.
