## Detailed tables for a poverty profile of Malawi

*From the poverty analysis of  
the Malawi Integrated Household Survey, 1997-98*

**Poverty Monitoring System\***  
**Government of Malawi**

*December 2000  
(revised)\*\**

### Introduction

The Integrated Household Survey (IHS) was a comprehensive socio-economic survey of the living standards of households in all districts of Malawi. The National Statistical Office administered the IHS questionnaire to more than 10,000 households over a 12 month period, November 1997 to October 1998. The survey was designed so that the information gathered could be used for an assessment of the incidence of poverty in the population at the district level and above.

Poverty is that condition in which the basic needs of a household (or individual) are not met. In order to determine whether or not a household is in poverty, one must do two things. First, one must establish a level of welfare for the household. That level, whether defined subjectively or objectively, will be compared to a level of welfare above which one assumes the basic needs of a household can be met. Establishing this poverty line is the second step in ascertaining the poverty status of a household.

A quantitative, relatively objective analytical process has been used for the poverty analysis of the IHS data set. A welfare measure for each household in the IHS data set was established by considering all of the expenditure and consumption reported by a household. This welfare measure is expressed as the total daily per capita consumption and expenditure of the household in Malawi kwacha.

The poverty line – that level of welfare distinguishing poor households from non-poor households – is also expressed in this same unit. That is, it is fixed in terms of total consumption and expenditure. It has an objective character in that it is anchored to the costs a household faces in meeting the recommended daily calorie requirements of its members, plus a certain level of basic non-food expenditure. The poverty line, consequently, can be disaggregated into food and non-food components.

As part of the poverty analysis of the IHS, an ultra-poverty line has been established. This line is arbitrarily defined as 60 percent of the poverty line. Its purpose is to allow a better understanding of the characteristics of households which are in dire poverty. In all of the tables in this document, the “Poor” category is inclusive of the “Ultra-poor”.

In several of the following tables three poverty measures are reported for various populations: the poverty head count, the poverty gap index, and the poverty severity index. For all three, the higher the index, the greater the level of poverty.

---

\* The poverty analysis of the 1997-98 Malawi Integrated Household Survey was carried out by two institutions of the Poverty Monitoring System – the National Statistical Office and the National Economic Council, with technical assistance provided by the International Food Policy Research Institute.

\*\* The revisions made are purely cosmetic. No statistics have changed. In several of the tables of the initial version a standard error placeholder – (s.e.) – remained in table cells for statistics for which no standard error could be calculated. These placeholders have been removed in this version. Removing these reduced the length of several tables, allowing tables which previously spread across several pages to be shortened. Consequently, the document as a whole is several pages shorter, and the pagination has changed.

The poverty head count simply presents the percentage of the population which is poor.

The poverty gap index calculates how far below the poverty line is the average level of consumption of poor households or individuals. This is reported as a proportion of the poverty line. The poverty gap index provides some indication of just how poor the poor people are, something which the poverty head count does not do.

The poverty severity index weights the level of consumption of poor people according to how far their consumption is below the poverty line: Poorer households receive heavier weights in calculating the index. It is most useful in comparisons. The policy implication of the poverty severity index is that attention should first be given to those areas where poverty is most severe.

Two data sets from the IHS were used in the analysis, one of 10,698 households, the other of 6,586. Households in the smaller data set had reliable consumption, expenditure, and income data necessary for establishing a poverty line. The 4,112 households not featuring in the smaller data set had good data for all modules of the IHS, except consumption, expenditure, and income. The poverty status of these households was determined by applying a model which generates a proxy household consumption value from household characteristics other than consumption, expenditure, and income. The proxy consumption values for these households were then compared to the poverty lines to classify the households as poor or non-poor.

Most of the tables are based on temporally deflated prices to a base of April 1998. Standard errors, where they can be calculated, are inserted in parentheses in the same table cell as the value to which they apply. These standard errors are corrected for the effects of survey design, specifically accounting for stratification and cluster sampling and the differing probabilities of selection of sample households which resulted from the sample selection procedure.

For most tables, six spatial units are used: Malawi, Southern region, Central region, Northern region, Rural, and Urban. The clearest patterns of the nature of poverty in Malawi are revealed by examining the Malawi, Rural, and Urban tables. In most cases, the regional tables are only useful in further investigating interesting patterns seen in one of the other tables. For most variables, few significant differences are seen between the three regions. This is due, in part, to the confounding effect of the presence of both rural and urban households within these spatial units: For many variables the contrast between rural and urban is shown to be sharper than that between wealth group within a region.

In the table cells for means in many of the statistical tables which follow, standard errors are provided in parentheses underneath the value for the cell. These are to use in judging whether or not the difference in means calculated for a variable for two separate populations is statistically significant. That is, it allows one to determine whether or not one can claim with a high degree of confidence that a specific characteristic really differs in its incidence between the two populations.

Quantitatively, a Z-score can be calculated using the standard errors and the means to assess whether the difference between the two means is significant. In its simplest form:

$$Z = \frac{\text{mean}_1 - \text{mean}_2}{\sqrt{s.e._1^2 + s.e._2^2}}$$

where  $\text{mean}_1$  is the first value,  $\text{mean}_2$  is the second value,  $s.e._1$  is the standard error of the first value, and  $s.e._2$  is the standard error of the second value.

If the absolute value of Z is greater than 1.282, the probability is less than 10 percent that there is no real difference between the means; if greater than 1.645, the probability is less than 5 percent.

## Table of contents

## POVERTY IN MALAWI

Table 1: Poverty line, food poverty line, non-food poverty line, and ultra-poverty line and spatial price indices at April 1998 prices, by poverty line region.

	Poverty line (MK)	Food (MK)	Non-food (MK)	Ultra (MK)	Food share of poverty line (%)	Spatial price index *
<b>Southern rural</b>	7.76	6.53	1.23	4.65	84.1	74.1
<b>Central rural</b>	9.27	7.76	1.51	5.56	83.7	92.3
<b>Northern rural</b>	11.16	8.90	2.26	6.69	79.7	112.4
<b>Urban</b>	25.38	16.95	8.43	15.23	66.8	222.1
<b>National weighted average poverty line</b>	10.47	-	-	-	-	100.0

\* Spatial price differences are revealed by the different poverty lines in each region. The poverty lines represent the different prices across the country for a comparable basket of goods necessary to meet the daily basic needs of an individual in Malawi. The spatial price index uses the weighted average poverty line (6,586 household data set) as a base, and is calculated as:  $100 * \text{total poverty line} \div \text{national weighted average poverty line}$ .

April 1998: MK 25.40 = US\$ 1.00

Table 2: Poverty line and ultra-poverty line at July 2000 prices (daily per capita consumption (MK)), by poverty line region.

	Poverty line	Ultra-poverty line
<b>Southern rural</b>	14.42	8.65
<b>Central rural</b>	17.22	10.33
<b>Northern rural</b>	20.74	12.44
<b>Urban</b>	47.18	28.31
<b>National weighted average poverty line</b>	19.47	-

Adjusted using the national total price index.

July 2000: MK 55.00 = US\$ 1.00

Table 3: *Individual poverty estimates and mean consumption by district, region, and rural/urban, 10,698 household data set.*

	Weighted IHS population share (%)	Mean consumption (MK / person / day) *	Median consumption (MK / person / day) *	Poverty headcount (% of population)	Poverty gap index	Poverty severity index	Absolute number of poor persons	Percent of Malawi's poor in area
<b>MALAWI</b>	100.0	11.16 (0.36)	8.38	65.3 (1.89)	0.24 (0.01)	0.11 (0.01)	6,308,805	100.0

<b>Urban</b>	10.3	17.44 (1.64)	9.67	54.9 (3.79)	0.20 (0.02)	0.10 (0.01)	649,181	10.3

This table should be used with caution. The welfare measures for 4,112 of the 10,698 households were estimated using a proxy welfare indicator model. The poverty measures presented here are only indicative, as they represent estimates based on estimates. The poverty measures from the 6,586 household data set are considerably more reliable. However, district level estimates cannot be generated from the smaller dataset.

\* Mean and median consumption values are calculated from temporally (April 1998) and spatially deflated kwacha values.

Table 4: *Household poverty estimates and mean consumption by district, region, and rural/urban, 10,698 household data set.*

	Weighted IHS household population share (%)	Mean consumption (MK / person / day) *	Median consumption (MK / person / day) *	Poverty headcount (% of households)	Poverty gap index	Poverty severity index	Absolute number of poor households	Percent of Malawi's poor households in area

Figure 1: Cumulative distributions for household welfare indicator. 10,698 and 6,586 household data sets, April 1998 and July 2000 prices

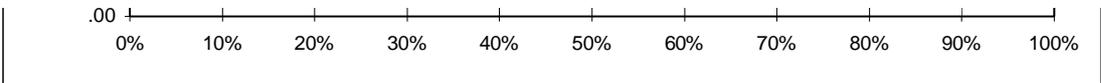

Figure 1: (Continued).

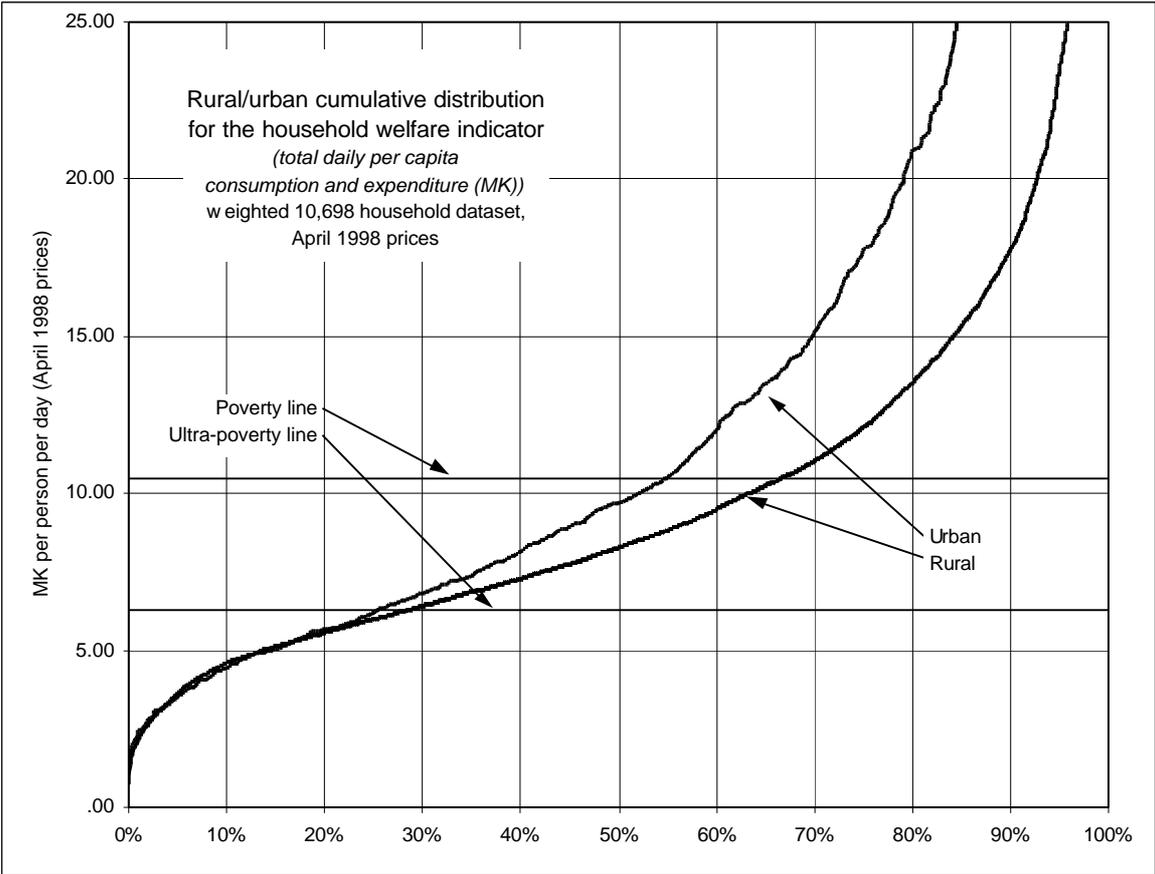

Figure 1: (Continued).

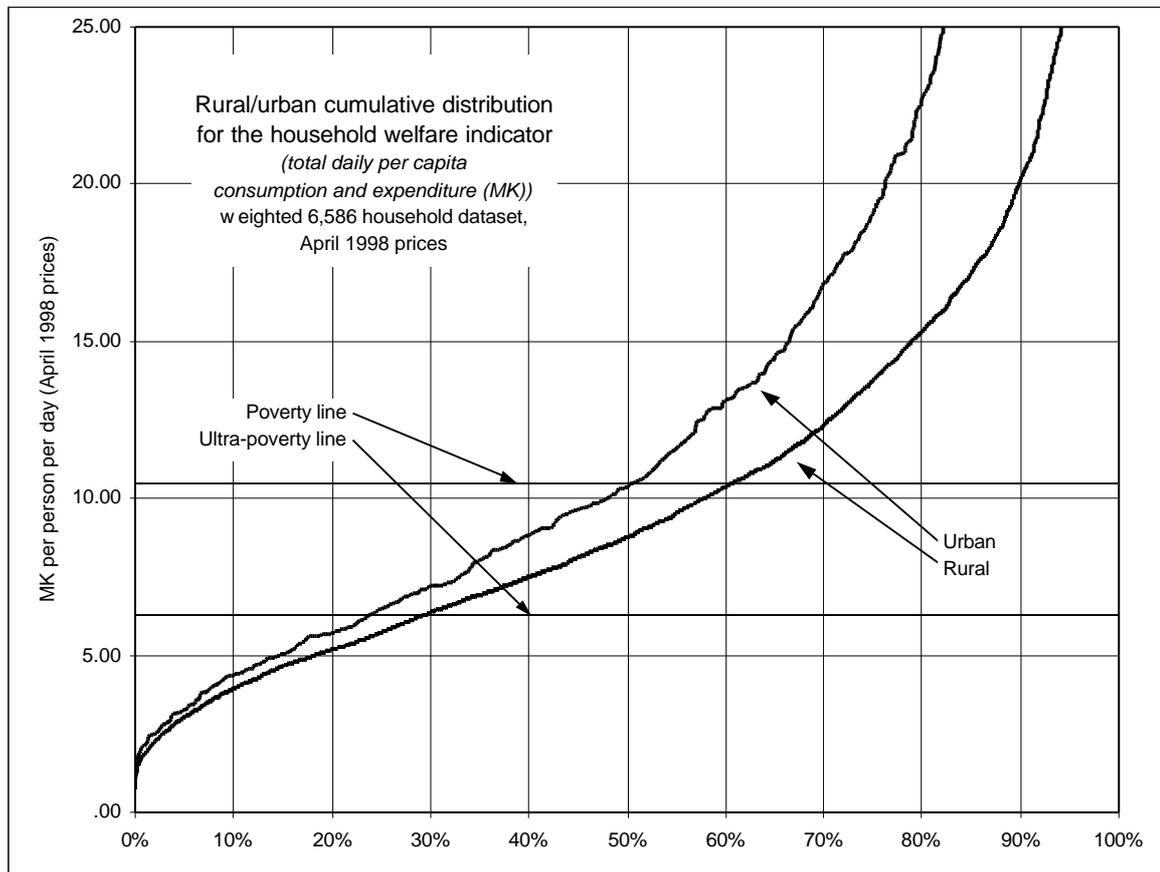

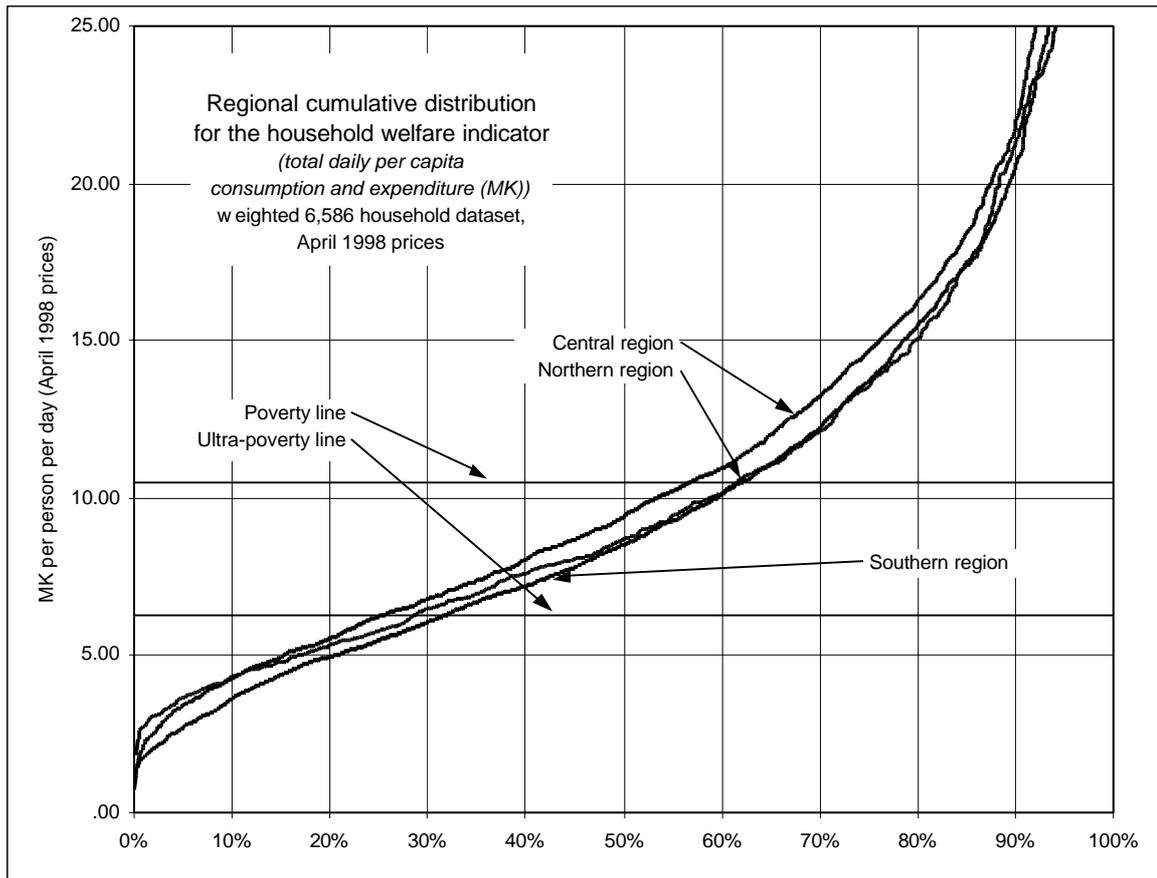

Table 11: Indices of welfare indicator inequality (total daily per capita consumption), by region (10,693 household data set).

	Gini coefficient *	Poorest quintile's percent of total consumption	Richest quintile's percent of total consumption	Poorest decile's percent of total consumption	Richest decile's percent of total consumption
<b>MALAWI</b>	0.368	7.7	45.1	3.1	30.6
<b>Southern region</b>	0.380	7.5	46.2	3.0	31.9
<b>Central region</b>	0.360	7.9	44.4	3.2	29.9
<b>Northern region</b>	0.340	8.1	42.7	3.4	27.9
<b>Rural</b>	0.334	8.2	42.1	3.3	27.3
<b>Urban</b>	0.515	4.9	58.3	2.0	43.2

Five households were dropped from the 10,698 household data set to compute these statistics. These five had unreasonably high welfare indicators. The welfare indicators of all five households were proxy welfare indicators, and so were estimates rather than actual reported levels of consumption and expenditure.

\* The Gini coefficient provides an indication of how equitable the distribution is across the population. A Gini coefficient of zero results if all households have the exact same level of consumption and expenditure – perfect equity. A coefficient of one results from a situation where all except one member of the population have no consumption and expenditure.

Table 12: Indices of welfare indicator inequality (total daily per capita consumption), by region (6,586 household data set).

	Gini coefficient *	Poorest quintile's percent of total consumption	Richest quintile's percent of total consumption	Poorest decile's percent of total consumption	Richest decile's percent of total consumption
<b>MALAWI</b>	0.401	6.3	46.8	2.5	31.8
<b>Southern region</b>	0.423	5.9	48.7	2.2	34.0

Information on literacy was only asked of adults who reported not having attended school. On average, one percent of household heads reported being literate without having attended school. However, coupling this information with that on educational attainment does not make it possible to infer overall literacy rates for household heads: The mere fact that one attended school does not necessarily imply that one is literate. No information on literacy rates can be derived from this information

The above categories are inclusive. That is, household heads who report having completed university also are included in the totals for having completed lower levels of education.

\*The synthetic fertility indicator estimates the number of children a women will give birth to over her child-bearing years. Age-specific birth rates were calculated for women grouped into 5-year age ranges (6 years for those aged 40-45), i.e. total births for women in age group over past year / total women in age group. These age specific birth rates were multiplied by the number of years in each age range. The results were then summed up to generate the fertility indicator for each wealth group.

Table 27: Fertility of women aged 15 to 45, by wealth group and highest educational level.

<i>Percentage of IHS sample women age 15 to 45 for which fertility information exists</i>	90.9	96.9	94.7	95.1

\*The synthetic fertility indicator estimates the number of children a women will give birth to over her child-bearing years. Age-specific birth rates were calculated for women grouped into 5-year age ranges (6 years for those aged 40-45), i.e. total births for women in age group over past year / total women in age group. These age specific birth rates were multiplied by the number of years in each age range. The results were then summed up to generate the fertility indicator for each wealth group.

Table 28: Adverse anthropometric nutritional indicators for children age 6 to 59 months, by percent of children with anthropometric indicator in wealth and sex group.

IHS weighted population (households)	493,184	1,095,738	905,835	2,001,573	45,924	106,778	134,254	241,032
IHS sample households	1,373	3,099	2,558	5,657	243	481	448	929

\* Note that the quartiles are not exactly 25% of all households due to lumping of land holding areas on certain land holding sizes. All land areas were estimated in acres, so rounding of household areas to half or whole acres was common.

Table 39: Food crops – cropping pattern, production, and sales of households, by crop, wealth group and region (6,586 household data set).

## DESCRIPTION OF DATA SET AND METHODOLOGICAL TABLES

Table 55: Integrated Household Survey questionnaire table of contents.

Section	Content	Coverage
A	Household Identification	Household head
B	Household roster	All individuals
C-1	Education of current potential students	All those aged under 25
C-2	Past education experience	All those aged 25 and above
D-1	Health condition in past 2 weeks	All individuals
D-2	Fertility	Women 15-45 years of age
D-3	Deaths in the household over past 12 months	Household head
E	Nutrition	Children between 6 mo. and 5 years
Annex E-1	Immunization	Children up to 5 years
F-1 & Annex	Agricultural crop production	Household head
F-2	Income from sale of livestock, poultry, and related products	Household head
F-3	Income from non-farming business (last one month)	Household head
F-4	Income from employment, transfers, and other income	Household head and those receiving such income
G-1	Employment and time use (last 12 months)	Individuals reported in Sec. B to be an 'employee', 'family business worker', self-employed' or 'employer'
G-2	Employment search (last 12 months)	If reported in Sec. B to be 'seeking work'
G-3	Time use of household members (last 7 days)	Individuals aged 5 and above
H	Migration	Individuals aged 10 and above
I & Annex	Housing and access to facilities	Household head
J-1	Assets – Household durables	Household head
J-2	Assets – Livestock and poultry	Household head
J-3 & Annex	Assets – Land (cultivated)	Household head
K-1 & Annex	Household expenditures – Own account (non-cash) food expenditure (last 3 days)	Household head
K-2	Major household expenditures	Household head
Annex L	Credit (last 12 months)	Household head
Diary	Diary of Expenditure	Household head

\* The expansion factors indicate how many households in the district population as a whole each sample household in that district represents.

The expansion factors for the 10,698 household data set are simple, being the result of dividing the estimated household population of the district by the number of sample households in the district, e.g. for Chitipa district:  $25,090 \div 220 = 114$ .

However, for fourteen districts of the 6,586 household data set, the expansion factors are based on the lumped population of adjoining districts. This was necessary due to the low sample numbers in this data set for some districts. The districts which were joined are Nsanje & Chikwawa, Mwanza & Blantyre Rural, Mulanje & Phalombe, Machinga & Mangochi, Ntcheu & Dedza, Dowa & Ntchisi, and Mzimba & Rumphi. The expansion factor for households in these districts is calculated as the sum of their household population divided by the sum of the sample households in each district, e.g. for Mzimba & Rumphi:  $(109,641 + 26,158) \div (347 + 22) = 368$ .

\*\* Balaka district was not yet created when the survey was designed. It was part of Machinga district at the time

\* Poorer households are defined as those households whose reported per capita daily calorie consumption does not exceed the median minimum daily per capita calorie consumption for households in the poverty line region.

Table 67: Components of the welfare indicator (total per capita daily consumption (MK)) for households whose welfare indicator is close to the poverty line, by poverty line region.

	Southern rural	Central rural	Northern rural	Urban	All
<b>Poverty line (MK)</b>	<b>7.76</b>	<b>9.27</b>	<b>11.16</b>	<b>25.38</b>	-
Use value of durable items owned (%)	2.2	1.3	1.1	2.3	1.7
Non-cash non-food consumption (%)	1.2	3.3	0.0	0.0	1.6
Non-cash food consumption (%)	50.0	60.4	59.1	4.5	44.6
Cash expend. on major non-food items (%)	10.5	11.3	14.1	28.2	15.2
Cash expend. on minor non-food items (%)	4.8	3.7	5.0	6.6	4.8
Cash expenditures on food (%)	25.8	16.6	17.9	43.5	25.5
Out-going income transfers (%)	1.7	1.3	0.8	3.9	1.9
Value of housing (%)	3.9	2.1	1.9	11.0	4.6
<b>Non-cash, cash, or mixed *</b>					
Non-cash expenditure and consumption (%)	53.3	65.0	60.2	6.8	47.9
Cash expenditure and consumption (%)	41.1	31.6	37.0	78.3	45.5
Mixed cash and non-cash (%)	5.6	3.4	2.8	14.9	6.6
Number of households in sample sub-set	285	305	101	103	794
Number of individuals in sample sub-set	1,168	1,426	416	412	3,422

Households whose welfare indicator was  $\pm 10\%$  of the poverty line were included here. A stair-step triangular weighting scheme was used in making these calculations which gave greater weight to those households whose welfare indicator is close to the poverty line: households whose welfare indicator was within one percent of the poverty line received a weight of 10, those between 2 and 3 percent received a weight of 9, and so on up to those between 9 and 10 percent of the poverty line receiving a weight of one.

\* Non-cash expenditures are the sum of the first three items in the section above, cash expenditures are the sum of the next three items, with mixed being the last two items. The mixed category includes those components of the welfare indicator for which information on the cash/non-cash nature of the expenditure was not consistently provided.

Table 68: Components of the welfare indicator (total per capita daily consumption (MK)) for all households, by poverty line region (6,586 household data set).

	Southern rural	Central rural	Northern rural	Urban	All
<b>Poverty line (MK)</b>	<b>7.76</b>	<b>9.27</b>	<b>11.16</b>	<b>25.38</b>	-
Use value of durable items owned (%)	2.8	2.0	2.3	4.2	3.0
Non-cash non-food consumption (%)	1.6	3.1	0.3	0.0	1.4
Non-cash food consumption (%)	43.0	54.5	47.7	3.0	32.8
Cash expend. on major non-food items (%)	14.5	13.2	19.4	39.7	23.4
Cash expend. on minor non-food items (%)	4.6	4.0	5.7	4.4	4.5
Cash expenditures on food (%)	26.1	16.5	17.5	24.9	22.1
Out-going income transfers (%)	2.5	3.1	3.9	5.8	4.0
Value of housing (%)	4.8	3.5	3.2	17.9	8.9
<b>Non-cash, cash, or mixed *</b>					
Non-cash expenditure and consumption (%)	47.5	59.6	50.4	7.2	37.2
Cash expenditure and consumption (%)	45.2	33.8	42.5	69.1	50.0
Mixed cash and non-cash (%)	7.3	6.7	7.1	23.7	12.9
Number of households in sample sub-set	2,468	2,379	810	929	6,586
Number of individuals in sample sub-set	10,597	10,979	3,368	4,002	28,946

\* Non-cash expenditures are the sum of the first three items in the section above, cash expenditures are the sum of the next three items, with mixed being the last two items. The mixed category includes those components of the welfare indicator for which information on the cash/non-cash nature of the expenditure was not consistently provided.
