## Income and Expenditure Survey 2000

The Income and Expenditure Survey (IES) 2000 data are in four files. The files are flat, ASCII, fixed field files, with one line of given length per record. This format was chosen so as to make the data usable with as many statistical programs as possible, and thus accessible to as wide a range of people as possible.

Other important information for users is found in the:

- ◆ Questionnaire
- ◆ Additional code lists (occupation, industry)
- ◆ Relevant publications
- ◆ Web-site ([www.statssa.gov.za](http://www.statssa.gov.za))

### THE DATA FILES

The files and the corresponding sections of the questionnaire are as follows:

**PERSON:** Data from Flap, Part 2404

**WORKER:** Data from Part 04

**HOME GROWN PRODUCTS:** Part 22

**GENERAL**

The files also contain some derived variables.

The information in each file contains the following:

- Nature of records in the file and population covered
- Description of variables

### Description of variables

The description of the variable comprises the following information:

**Descriptive name:** This is a short English description plus the variable name in the original file used by Stats SA to construct the ASCII file.

**Position of the variable:** The position of the data within the record, recorded in the format (@xxx y). “@xxx” indicates that the data begins at position (i.e. column) xxx and “y” indicates that it is y digits wide. A “y.d” format, as used for the weights, is “y” digits wide with “d” decimal places. All data is numeric. All data is thus right-justified.

**Source:** This is either the question in the questionnaire or, for derived variables, the method of derivation. Derived variables are usually found towards the end of a record.

**Valid range:** The range of valid values for the variable. For continuous variables this reflects the upper and lower limits as found in the data.

+

+

**Not applicable:** The code for not applicable is provided for each variable. These are now numeric.

**Missing value:** A code for “missing”/unspecified values is given for each variable. For Expenditure and Income missing value is not coded.

**Notes:** Specific observations to be noted by users.

Some of the questions in the Income and expenditure survey questionnaire are pre-coded, i.e. there is a set number of choices from which one or more must be selected. For open-ended ‘write-in’ questions, the description will note that post-coding occurred and explain how this was done. For most variables the coding is apparent from the questionnaire (available elsewhere in the documentation) and is not repeated in the variable description. Where the coding is not apparent, the description either provides the codes or indicates where code lists are to be found.

### **Linking files**

The data from the four different files can be linked on the basis of a record identifier. The record identifier is the first field/s in each file. Each record contains a unique number (UqNr), position 1 to 13, which constitutes a household identifier.

## **METHODOLOGY**

### **Sample design**

The Master Sample is based on the 1996 Population Census of enumeration areas (EA) and the estimated number of dwelling units from the 1996 Population Census. All 3000 PSUs included in the Master Sample were used in the Income and expenditure survey. A PSU is either one EA or several EAs when the number of dwelling units in the base or originally selected EA was found to have less than 100 dwelling units. Each EA had to have approximately 150 dwelling units but it was discovered that many contained less. Thus, in some cases, it has been found necessary to add EAs to the original EA to ensure that the minimum requirement of 100 dwellings, in the first stage of forming the PSUs, was met. The size of the PSUs in the Master Sample varied from 100 to 2445 dwelling units. Special dwellings such as prisons, hospitals, boarding houses, hotels, guest houses (whether catering or self-catering), schools and churches were excluded from the sample.

Explicit stratification of the PSUs was done by province and area type (urban/rural). Within each explicit stratum, the PSUs were implicitly stratified by District Council, Magisterial District and, within the magisterial district, by average household income (for formal urban areas and hostels) or EA. The allocated number of EAs was systematically selected with “probability proportional to size” in each stratum.

Once the PSUs included in the sample were known, their boundaries had to be identified on the ground. After boundary identification, the next stage was to list accurately all the dwelling units in the PSUs. The second stage of the sample selection was to draw from the dwelling units listing whereby a systematic sample of 10 dwelling units was drawn from each PSU. As a result, approximately 30 000 households (units) were interviewed. However, if there was growth of more than 20% in a PSU, then the sample size was increased systematically according to the proportion

+

+

of growth in the PSU. The plan is to implement a 20% rotation scheme. This means the same dwellings will be visited, at most, on five different occasions. After the 5<sup>th</sup> visit, new dwelling units will be included to replace the ones that will be dropped.

**Weighting**

The initial weights (household weights), based on the sample design, were equal to the inverse of the probability of selection.

That is:

$$\text{Household weight} = 1/P1 * P2$$

where:

$$P1 = \frac{(\text{Census number of households in PSU}) * (\text{number of PSUs in stratum})}{\text{Census total number of household per stratum}}$$

$$P2 = \frac{\text{Sample size [that is, 12 dwelling units per PSU]}}{\text{Number of dwelling units in the selected PSU}}$$

The initial weight for each member of the household was the same as the weight for the household itself.

Further adjustment factors were then calculated within PSUs to account for non-response.

To adjust for under-enumeration and to align survey estimates with independent population estimates, the weights were calibrated against Person benchmarks. A software package called CALMAR was used to perform this calibration. Using an iterative procedure, CALMAR adjusted the weights so that Person estimates conformed as closely as possible to external Person benchmarks. Gender, race and age group parameters were used for the Person cross-classification of the population.
