Average Agriculture Holding Size

LEGEND

PREFACE

Agriculture is the key economic activity and a source of livelihood for the majority of the population, thus a program of annual survey supplemented by a decennial census to establish changes in structure is a matter of major concern.

In recognition of the importance of improving and expanding the statistical base to provide for effective planning and policy making, Nepal has been conducting decennial census of agriculture since 1961/62. This Agricultural Census Monograph presents a bird's eye view of the findings of the National Census of Agriculture – 2001/02 in all major aspects of agricultural activities.

The reference period for the complete count of agricultural holdings and total area of the holdings was 2001 as it was collected along with the listing operation of the Population Census 2001. The reference period for the rest of the characteristics of the holdings such as livestock and poultry counts, tenure of holdings, area of parcels, etc., was at the time of enumeration which was conducted from January to June, 2002. Comparability and availability of data has restricted analysis since 1961/62 to few variables only. In order to access the growth and development of agriculture in Nepal, most of the comparative analysis presented in this monograph is between 1991/92 and 2001/02 agricultural census data.

As in the previous censuses, attempts have been made to adhere to the concepts and definitions recommended by the FAO so that there is comparability of data between censuses and internationally too. As per the local and international requirements, few new items of information have been included in the census which was not gathered in the past. Aspects such as, soil type, soil color and food sufficiency/insufficiency etc. have been incorporated in the analysis for the first time.

There are 17 chapters in this report representing the different aspects in agriculture. Chapter 1 provides a general perspective on the total households and population linking them to the farm population and holdings. Chapter 2 to 5 present analysis on agricultural structure such as size of holding, land fragmentation, land tenure and land use. Analyses of temporary and permanent crops are dealt in Chapters 6 and 7. Chapters 8 and 9 examines the use of are agricultural inputs. Chapter 11 presents livestock and poultry population scenario. Chapter 12 deals on ancillary activities of agricultural holding and Chapters 10, 13 and 14 discuss other facilities available to the holding in terms of equipment, buildings and credit. Chapter 15 provides insight to disparity in holdings and operating pattern of holdings of male and female holders. The last two chapters analyze socio-economic characteristics of the farm population and farm labor.

This Monograph has been prepared with the combined effort of Mr. R. C. Das, Retired Senior Officer of the Bureau and Consultants from the Asian Development Bank who were involved at the initial stage of analysis. I would like to express my sincere thanks to them. My sincere thanks also go to Deputy Director General, Mr. Rabi Singh for his overall supervision and hard work put in by Statistical Officers Mr. S.L. Shrestha and Mr. R. Dhital. Thanks are also due to Computer Assistants Mr. L.N. Pandey and Mr. D.N. Shrestha for their computer works in preparation of this Monograph.

June, 2006
Kathmandu, Nepal

T.S. BASTOLA

TABLE OF CONTENTS

	Page
Agricultural Census, 2001/02 at a Glance	a
CHAPTER 1 : BACKGROUND	1
1.1 Land area	1
1.2 Population.....	1
1.3 Population density	2
1.4 Population growth	2
1.5 Usual activity of population 10 years old and over	2
1.6 Employment rate	3
1.7 Usual activity of employed persons	3
1.8 Number of households.....	3
1.9 Number of agricultural holdings	4
1.10 Farm population.....	5
CHAPTER 2 : SIZE OF HOLDING	11
2.1 Land holdings	12
2.2 Average size of holding.....	12
2.3 Farm size distribution	13
2.4 Land distribution	14
CHAPTER 3 : LAND FRAGMENTATION	23
3.1 Number of parcels	24
3.2 Parcel size	24
3.3 Parcels per holding	25
3.4 Parcel number distribution	25
3.5 Comparison of small and large holdings	27
CHAPTER 4 :LAND TENURE	35
4.1 Holdings by tenure	36
4.2 Area by tenure of land	36
4.3 Conditions of rent	38

CHAPTER 5 : LAND USE		48
5.1	Land use types	49
5.2	Arable land	50
5.3	Percent of land for cultivation	53
5.4	Land use pattern in small and large holdings	54
5.5	Wet and dry land	54
CHAPTER 6 : TEMPORARY CROPS		64
6.1	Land under temporary crops.....	65
6.2	Composition of temporary crops	65
6.3	Rice.....	67
6.4	Wheat.....	69
6.5	Maize	71
6.6	Other cereal grains.....	72
6.7	Legumes	72
6.8	Tubers	73
6.9	Cash Crops.....	73
6.10	Oilseeds	74
6.11	Spices.....	74
6.12	Vegetables	75
6.13	Cropping practices.....	76
6.14	Cropping intensity	76
CHAPTER 7 : PERMANENT CROPS		101
7.1	Permanent crops grown	102
7.2	Compact and scattered crops	102
7.3	Ecological belt comparisons	103
7.4	Development regions comparisons	103
7.5	Comparison of small and large holdings	104
7.6	Productive/non-productive trees.....	105
7.7	Thatch, fodder trees and bamboo	105
CHAPTER 8 : IRRIGATION		120
8.2	Concept of Irrigation	121
8.2	Land holdings with access to irrigation.....	121
8.3	Land under irrigation.....	122
8.4	Source of irrigation.....	123

CHAPTER 9 : USE OF INPUTS		129
9.1	Agricultural inputs.....	130
9.2	Growers using chemical fertilizers.....	130
9.3	Growers using improved seeds.	131
9.4	Growers using pesticides.....	131
9.5	Rice.....	132
9.6	Wheat.....	132
9.7	Maize.....	133
9.8	Other crops.....	134
9.9	Comparison of small and large holdings.....	134
CHAPTER 10 : AGRICULTURAL EQUIPMENT		144
10.1	Agricultural equipment.....	145
10.2	Type of equipment.....	145
10.3	Geographical distribution of equipment.....	146
10.4	Comparisons of small and large holdings.....	146
CHAPTER 11 : LIVESTOCK AND POULTRY		152
11.1	Livestock population.....	153
11.2	Holdings with livestock and poultry.....	153
11.3	Cattle.....	154
11.4	Chauri.....	155
11.5	Buffaloes.....	155
11.6	Large livestock in milk.....	156
11.7	Small livestock.....	156
11.8	Poultry.....	157
CHAPTER 12 : ANCILLARY ACTIVITIES		164
12.1	Ancillary activities.....	165
12.2	Forestry activities.....	165
12.3	Compact forest area.....	165
12.4	Holdings with forest trees.....	166
12.5	Area of woodland and forest.....	166
12.6	Distribution of Forest Trees.....	167
12.7	Fishery activities.....	167

CHAPTER 13 : NON-RESIDENTIAL BUILDINGS	172
---	------------

13.1 Non-residential building	173
13.2 Holdings with non-residential buildings	173

CHAPTER 14 : HOLDINGS WITH CREDIT	176
--	------------

14.1 Agricultural Credit.....	177
14.2 Holdings with credit	177
14.3 Regional comparisons	177
14.4 Source of credit	177

CHAPTER 15 : CHARACTERISTICS OF AGRICULTURAL HOLDERS AND AGRICULTURAL HOLDINGS	183
---	------------

15.1 Characteristics of agricultural holders.....	184
15.2 Sex of holder	184
15.3 Age of holder.....	185
15.4 Size of holding per holder	186
15.5 Headship of household	186
15.6 Hired manager	187
15.7 Ethnicity	188
15.8 Ethnicity in ecological belt.....	188
15.9 Ethnicity in development region	189
15.10 Legal status of holding/holder	189
15.11 Main use of produce of holding.....	190
15.12 Sufficiency of agricultural produce	191
15.13 Number of months insufficient.....	192
15.14 Manner of coping with insufficiency	192
15.15 Soil type and color.....	193
15.16 Uncultivable area due to flood/soil erosion.....	194

CHAPTER 16 : FARM POPULATION	218
-------------------------------------	------------

16.1 Information on farm population	219
16.2 Farm population.....	219
16.3 Age and sex structure	219
16.4 Sex ratio.....	220
16.5 Household size.....	220
16.6 Comparison of small and large holdings	221
16.7 Some characteristics of districts	221

CHAPTER 17 : FARM LABOUR	234
17.1 Usual activity of farm population.....	235
17.2 Labour force status of farm population	236
17.3 Employment and unemployment rates	236
17.4 Employment of agricultural workers.....	237
17.5 Paid workers at sub-national level.....	238
17.6 Paid workers by size of holding	238
17.7 Number of permanent agricultural workers	238
Appendix A : Sample Specifications – Districts	i
Appendix B : National Sample Census of Agriculture 2002	
Schedule 2	iii

CHAPTER 1

BACKGROUND

1.1 Land area

Nepal is a landlocked country bounded on the north by China and on the south, east and west by India. Ecologically, the country is divided into three belts, namely: Mountain belt, Hill belt and Tarai belt, running east to west with a non-uniform width from north to south. Mountain belt covers mountainous areas of the country and lies in the north. The altitude ranges between 4,899 meters to 8,848 meters above sea level. Some parts of the belt are covered with snow all year round including the highest peak of the world, the Mount Everest. The Hill belt is located in between the Mountain and Tarai belts. The belt has a fertile valley and basins such as Kathmandu and Pokhara. The belt on the southern part of the country is Tarai. Being an extension of the Gangetic plains of India, it has low flat land as well as dense forest. The country has a total land area of 147,181 square kilometers. Hill ecological belt shares 61,345 square kilometers of land, which is approximately 42% of the total land area. Mountain belt reported the second largest land area of about 36% while Tarai belt occupied the smallest area of 34,019 square kilometers or 23% of the total.

Administratively, the country is divided into 75 districts grouped into 5 development regions that cut across ecological belts. The Mountain belt constitutes 16 districts, 39 districts in the middle comprise the Hill belt and 20 districts compose the Tarai belt.

Among eco-development regions, Central Tarai reported the largest population of 3.9 million people comprising about 17% of

Development regions are made up of districts. Mid-Western development region got the biggest share of 43,378 square kilometers or about 28.8% of the total land area while Far- Western region reported the least with 19,539 square kilometers, which is about 13.3% of the total. Western, Eastern and Central development regions occupied almost the same area of about 29,000 square kilometers.

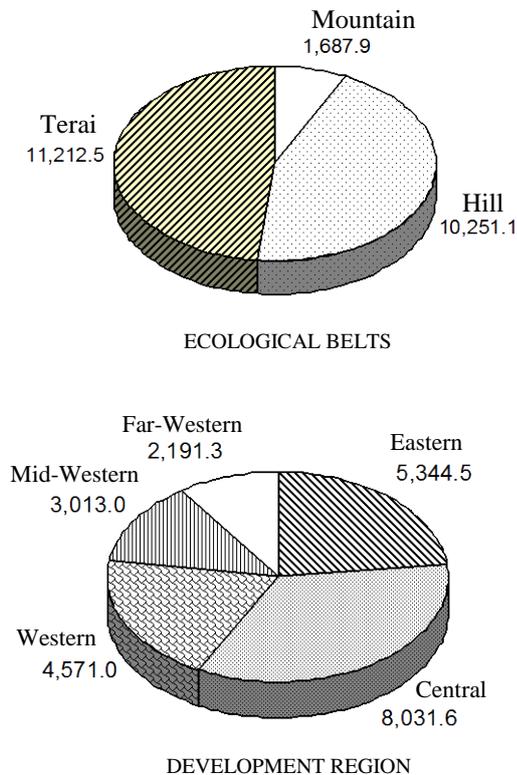

Five ecological-development regions also known as eco-development regions are formed within a belt. In the Mountain belt, Mid-Western Mountain got the biggest land area of 14.5% of the total, followed by Western Hill with 12.4%. Between 5% and 9% of the total land area was reported by the following: Mid-Western Hill (9.3%), Central Hill 8.0%), Eastern Hill (7.3%), Eastern Mountain (7.1%) and Central Tarai (6.3%). All the rest of the eco-development regions reported the land area to be less than 5% of the total with Far-Western Tarai reporting the least area of 3.3% of the total.

1.2 Population

The Population Census 2001 of Nepal recorded a total population count of 23,151,423 persons. About 48.43% of the total populations were found in Tarai belt and 44.28% were in Hill belt. Mountain belt reported a population of only 7.29% or about 1.688 million people.

More than one-third (34.7%) of the total population was found in the Central region and only 9.5% were in Far-Western region. the total population of Nepal. The second largest population was reported by Central Hill with 3.5 million or about 15.3%, see TABLE 1.1.

FIGURE 1.1: POPULATION DISTRIBUTION, 2001
(*000)

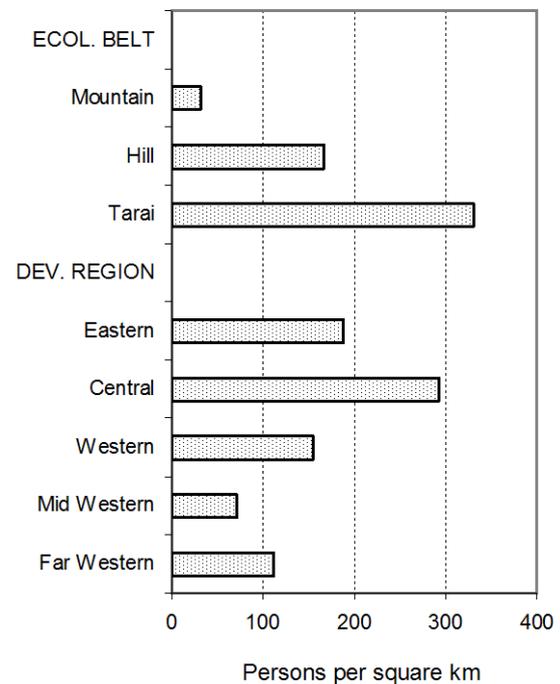

1.3 Population density

While Tarai belt was reported to have the least territorial area among the ecological belts, it reported the highest density of population of 330 persons per square kilometer (sq. km.) in 2001. The average population density in Nepal was only 157 persons per sq. km. because of the low population density in the Mountain and Hill belts of 32 persons per sq. km. and 167 persons per sq. km., respectively.

1.4 Population growth

The geometric growth of the population of Nepal registered at an average annual rate of 2.27% per annum between 1991 and 2001. Tarai belt contributed mainly to the high population growth considering that Hill and Mountain belts grew only at the rate of 1.99% and 1.58% annually, respectively, for the same period of time.

FIGURE 1.2:
POPULATION DENSITY, 2001

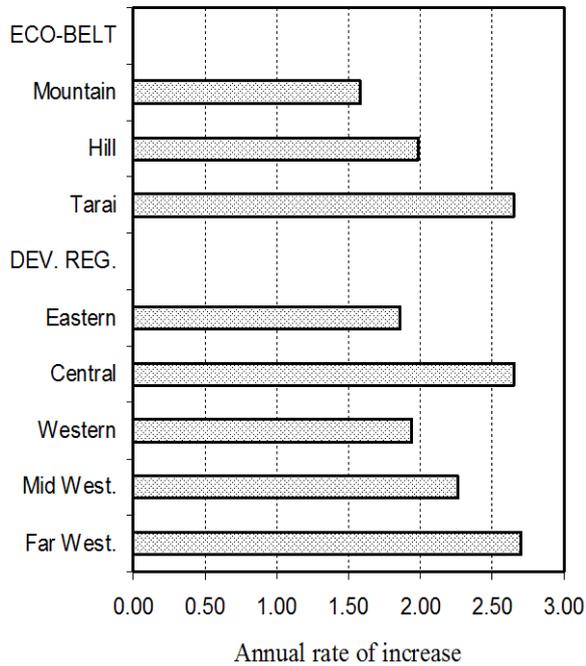

1.5 Usual activity of population 10 years old and over

Population 10 years old and over was composed of 16,770,279 or 72.4% of the total population of Nepal. This population age group is the potential supply of labour in the country. In the Population Census 2001, 9,110,336 persons were found to be economically active. These represents a participation rate of 54.3% of the total population 10 years old and over while those who are not economically active comprised 45.7%, see TABLE 1.2.

Among males, the participation rate was 64.9% while among females, the participation rate was very much lower at 43.9%.

Economically active population consists of persons who were usually employed or seeking work during the reference period. The proportion of economically active population to the total population 10 years

FIGURE 1.3:
POPULATION RATE OF GROWTH
1991 TO 2001

old and over multiplied by 100 is the labour force participation rate.

Persons who were not economically active are those who were doing household chores, full time students or no activity at all.

1.6 Employment rate

Total persons who were usually employed consisted of 8,940,107 out of a total of 9,110,336 economically active persons and this yielded an employment rate of 98.1%. On the other hand, only 1.9% of the economically active population was looking for work or considered unemployed.

While the labour force participation rate of the females was only 43.9%, their employment rate was much higher at 99.1% or an unemployment rate of only 0.9% compared with the employment rate of 97.5% among males with an unemployment rate of 2.5%. This trend indicates that when women decide to

become economically active, they have better chances of being employed than the men since they have exhibited a lower unemployment rate.

1.7 Usual activity of employed persons

Agriculture or own farm work was reported by 5.146 million persons or about 57.6% of the total population who had jobs during the reference period; salary/wage workers numbered 2.189 million or 24.5%; about 968 thousand or 10.8% had their own economic enterprise while 635 thousand or 7.1% were engaged in extended economic activity.

Females comprised about 48% of those with employment and almost two-thirds of them were found in agriculture or in their own farms. Extended economic activity was reported by some 14% among the females; 12.2% had salary/wage employment and only 6.7% reported working in own economic enterprise.

The picture on the usual activity of males is a little different. Only about half (51.0%) of the employed males were in agriculture and about one-third (33.0%) had salary and/or wage work and 13.7% with economic enterprise. Only 2.2% among males reported extended economic activity.

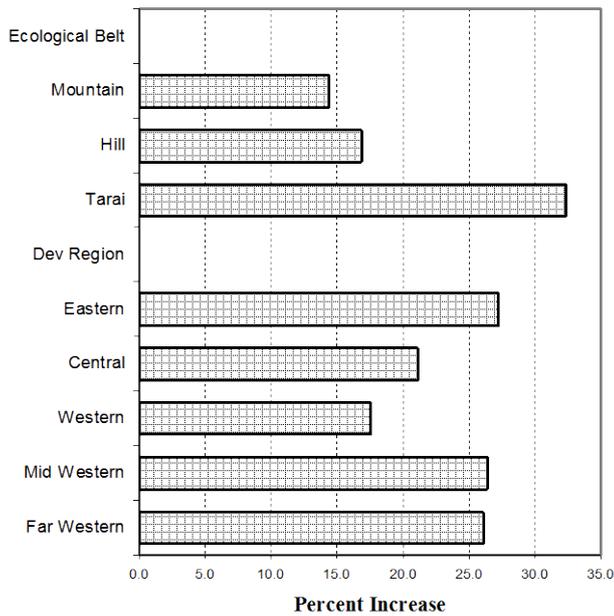

Although about half of the males and two thirds of the females were in agriculture, the males still dominated in number the agriculture work with 2.7 million out of 5.2 million workers in agriculture. The males also dominated the employment in salary/wage work (79.5%) and in own enterprise (74.6%). As expected, the females dominated the work on extended economic activity with 81.6%, see Table 1.3.

1.8 Number of households

The total number of households in Nepal in 2001 was 4,253,220. Hill ecological belt

reported the highest number of 1.982 million households comprising 46.6% of the total followed closely by Tarai belt with 1.95 million households, which was 45.9% of the total. The Mountain belt reported the lowest number with only 310 thousand or 7.5% of the total households in the country, see TABLE 1.1.

FIGURE 1.4: NUMBER OF AGRICULTURAL HOLDINGS INCREASE FROM 1991/92 TO 2001/02

1.9 Number of agricultural holdings

For purposes of the 2001/02 Agriculture Census of Nepal, an agricultural holding was defined as an economic unit of agricultural production under a single management comprising all livestock and all land used wholly or partly for agricultural production purposes. In Nepal, it is not uncommon that an agricultural holding is equivalent to a farm household.

There were 3.3641 million agricultural holdings identified from the listing operation done during the first phase in the conduct of the Population Census 2001. These holdings were found in the following ecological belts: Hill ecological belt reported a total of 1.5864 million

agricultural holdings equivalent to 47.1% of the total holdings in the country; Tarai belt accounted for 1.4795 million agricultural holdings which consisted of 43.9% of the total; and, Mountain belt reported 298.2 thousand agricultural holdings consisting of only 8.8% of the total holdings in Nepal.

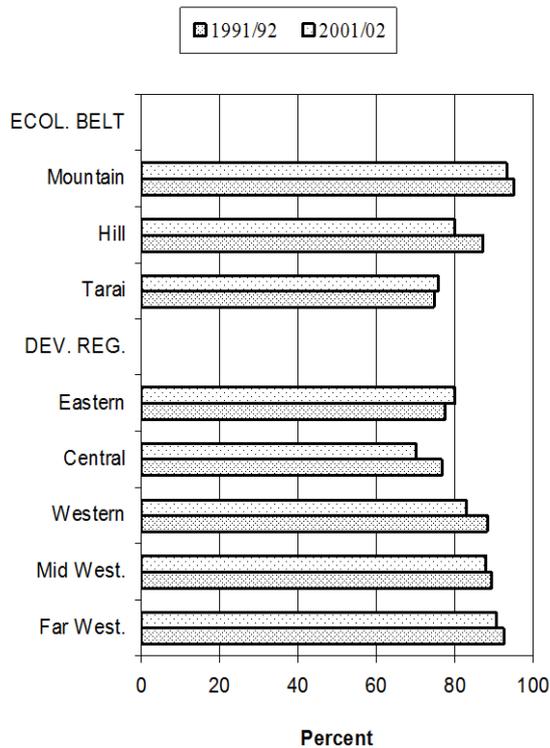

Among development regions, Central region reported a total of 1.098 million agricultural holdings, which is almost one-third of the total holdings in the country. The second largest region reporting agricultural holdings is Eastern region with about 850 thousand which is about one-fourth of all holdings in Nepal. Far Western region reported the least, which was about 10.8% of the total holdings.

In a span of ten years, the number of agricultural holdings increased by 22.8%, an average annual increase of 2.3% which is also almost the same rate of increase in the population.

There has been a decreasing proportion of households that operated agricultural holding between 1991/02 and 2001/02 in Nepal from 82.2% in 1991/92 to 79.1% in 2001/02. The decrease in the proportion of households operating an agricultural holding was felt most in the Hill ecological belt. In 1991/92 about 87.1% of the total households operated an agricultural holding but this proportion decreased to 80% in 2001/02, a decrease of 7.1 percentage points. There was also a decrease in the proportion of households who were operating an agricultural holding in the Mountain belt but only slightly when compared with the Hill belt, from 95.1% in 1991/92 to 93.2% in 2001/02. Tarai belt, however, did not experience such a decrease.

The proportion of households who operated an agricultural holding even increased slightly from 74.7% in 1991/92 to 75.8% in 2001/02.

FIGURE 1.5: HOLDINGS AS PERCENT OF HOUSEHOLDS 1991/02 AND 2001/02

The decreasing proportion of households operating an agricultural holding in Hill and Mountain belts may be attributed to urbanization and industrialization where more non-agricultural activities are available to the population.

1.10 Farm population

The Population Census 2001 of Nepal has put the farm population count at 19.0325 million people of which 46.6% were found in Tarai and 45.2% were in Hill.

Only 8.2% or about 1.6 million were residing in the Mountain ecological belt.

Among the development regions, Central region reported the biggest farm population at almost 6 million people followed by Eastern region and Western region with 4.3 million and 4.0 million, respectively.

Considering that a holding and a farm household are almost identical, it is therefore not far fetch to see that the proportion of the farm population in relation to the total population is also going down in urbanizing areas.

Between 1991/92 and 2001/02, there has been a decline in the proportion of the farm population to the total population in Nepal from 87.9% to 82.2%, see TABLE 1.6. The same trend is true for the three ecological belts, from 100% farm population in 1991/92 to 93% in 2001/02 for the Mountain; from 92% farm population in 1991/92 to 83.9% in 2001/02 for the Hill and from 81.9% farm population in 1991/92 to 79% in 2001/02 for Tarai belt, see TABLE 1.7.

The same pattern is observed among all the development regions with Central region registering the biggest change in proportion from 81.8% farm population in 1991/91 to 74.3% in 2001/02, see TABLE 1.8. Two urbanized cities are in this region, namely: Kathmandu and Lalitpur that may have contributed to the decrease in the farm population due to urbanization.

CHAPTER 2 SIZE OF HOLDING

Agricultural Census 2001/02 revealed that there were 3,364.1 thousand agricultural holdings in Nepal. Of these 3,337.4 thousand holdings were with land area of 2,653.9 thousand hectares. A total of 26.7 thousand agricultural holdings were without land. Number of agricultural holding has been increasing in every successive agricultural census. Compared to 1961/62, number of agricultural holding increased by 11.8 percent in 1971/72. Likewise, the percentage increase in number of agricultural holdings in every succeeding decennial agricultural census thereafter is 27.5, 24.7 and 22.9 respectively.

Total area of land holdings has been increasing steadily. It has increased by 57.5 percent over 40 years, from 1,685.4 thousand hectares in 1961/62 to 2,653.9 thousand hectares in 2001/02. There was a big increase in the area of land holding

between 1971/72 and 1981/82 censuses. The increase in area of land holding was about 49 percent during the period between these two censuses. However, the rate of increase slowed down thereafter. The increase in land area in 1991/92 was 5.4 percent compared to 1981/82. Between 1991/92 and 2001/02 censuses the increase was only 2.2 percent.

The number of agricultural holdings without land has decreased to 26.7 thousand in 2001/02 from 32.1 thousand in 1991/92.

Though there is a steady increase in the total land area of the holdings, the average area per holding which was 1.11 hectares in 1961/62 decreased to 0.80 hectares in 2001/02. The reduction in the average area per holding can be attributed to rapid increase in the number of holdings in the country.

2.1 Land holdings

There were 3.3641 million agricultural holdings in Nepal with a total land area of 2.6539 million hectares. There are two types of holdings: agricultural holdings that use land in their farming operations and agricultural holdings that did not require the use of land in their operations, most of which were engaged in the raising of livestock and poultry.

The number of agricultural holdings with land has been proportionally increasing since 1961/62 but in 1981/82 and 1991/92 there was a slight decrease in the proportion from 99.6% to 98.8%. However, there was a slight increase in the proportion of holdings with land to 99.2% in 2001/02.

The slight increase in the proportion of holdings with land had resulted to the decrease in the actual number of holdings without land between 1991/92 and 2001/02 from 32.1 thousand to 26.7 thousand holdings, see TABLE 2.1

While land in general is a fixed capital asset, it is observed that the total land area of holdings in Nepal has been steadily increasing since 40 years ago from 1.685 million hectares in 1961/62 to 2.6539 million hectares in 2001/02. The increase involved almost a million hectares (968.5 thousand hectares) which is about 57.5% in 40 years or a yearly average increase of 1.44%.

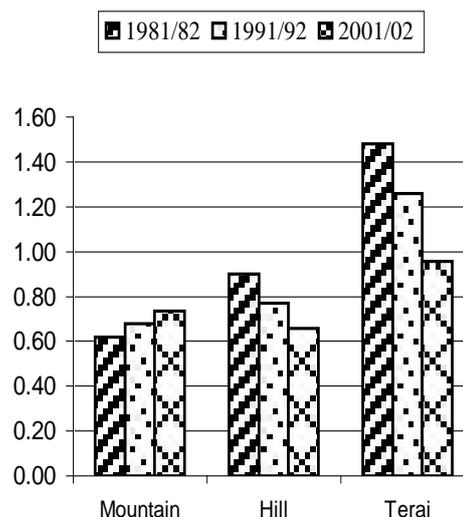

The big increase in the area of land holdings occurred between 1971/72 and 1981/82 where 49% of the total land area of the holdings increased in a span of 10 years.

However, between 1981/82 and 1991/92, the increase went down to only 5.4% in a period of 10 years and the increase further

went down to only 2.2% between 1991/92 and 2001/02.

The total number of holdings operated by female holders in 2001/02 was 271.51 thousand or 8.1% of the total holdings in

FIGURE 2.1: AVERAGE SIZE OF HOLDINGS, ECOLOGICAL BELTS

Nepal with an area of about 144 thousand hectares.

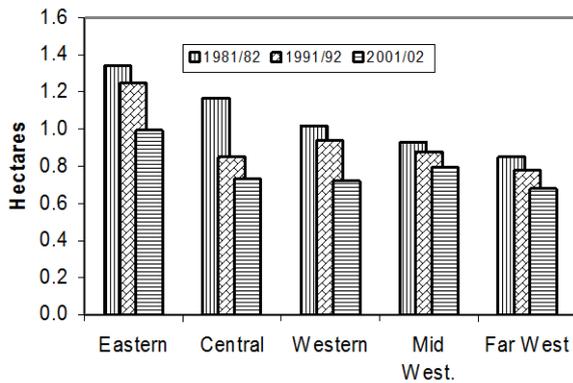

Of the total holdings operated by females, 269 thousand or 99.1% are with land. The male holders reported a slightly higher proportion of 99.2% or 3.068 million holdings with land with a total area of 2.51 million hectares. The area of the holdings with no land is almost nil, see TABLE 2.4a.

2.2 Average size of holding

Despite the steady increase in the total land area of the holdings, the average area per holding has been decreasing from 1.11 hectares in 1961/62 to 0.80 hectare in 2001/02. This is expected because the increase in the number of agricultural holdings was faster than the increase in the total area of all holdings in the country

By ecological belt, the total number of holdings with land is generally increasing although proportionally, the holding with

FIGURE 2.2: AVERAGE SIZE OF HOLDINGS, DEVELOPMENT REGIONS

land in the Mountain belt area remained at 99.7% in both census years 1991/92 and 2001/02.

Holdings in Tarai belt reported the largest average of 1.48 hectares in 1981/82 but because of the decreasing trend it is only 0.96 hectare in 2001/02.

In fact the average area per holding in both Hill and Tarai belts continued to decrease throughout the four census periods. This is not the case of the holdings with land in Mountain belt. Since 1981/82, the average size of the holding in Mountain belt has been increasing from 0.62 hectare to 0.68 hectare in 1991/92 to 0.74 hectare in 2001/02. The slow but steady increase in the average size of the holding in Mountain belt has already surpassed the level of the average size of the holding in Hill belt of 0.66 hectare in 2001/02, from 0.90 hectare in 1981/82. The decreasing size of the holding in Hill belt may not be due only to the increasing number of holders but also to the decreasing land area available for agriculture due to urbanization. This is borne by the fact that there was decrease in the total land area of the holdings in Hill belt between 1991/92 and 2001/02 from 1.0462 million hectares to 1.0386 million hectares in 2001/02, a decrease of 7.3%.

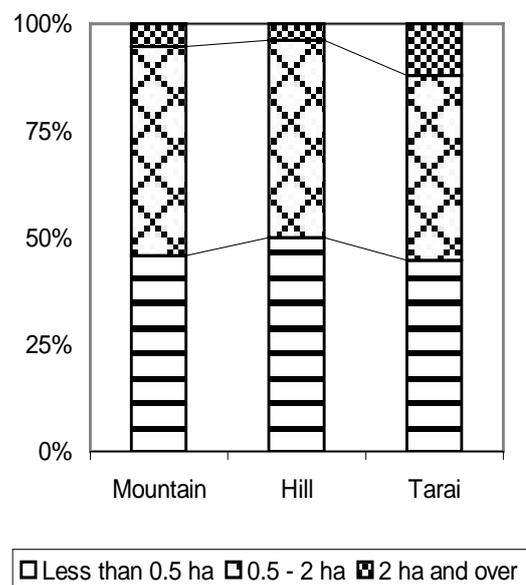

For female holders, the average size of the holding reported in 2001/02 was only 0.53

compared with the average size of the holding of the male holders at 0.82 hectare. This wide gap in the average size of the holding between the male and the female holders may imply the disadvantage position of the female holder as the head of the household.

2.3 Farm size distribution

Of the 3.337 million holdings, about 260.5 thousand or 7.8% of the total reported their farm area to be less than one-tenth of a hectare, see TABLE 2.4. On the other hand, almost the same number (254.2 thousand) or about 7.5% of the total reported their farm size as at least 2 hectares.

FIGURE 2.3: SIZE DISTRIBUTION OF HOLDINGS, ECOLOGICAL BELTS, 2001/02

The farm sizes in Nepal are getting smaller. Almost three-fourths (74.7%) of the holdings reported less than a hectare in area in 2001/02 compared with 69.5% in 1991/92, and 66.6% in 1981/82, see TABLE 2.5.

By ecological belt, the above chart shows that Tarai reported the most number of holdings with at least 2 hectares (12.1%)

compared with only 5.5% for the Mountain holdings and 3.8% for the Hill belt holdings.

However, for less than one-tenth of a hectare, Tarai belt reported the most number of holdings (10.8%) compared with only 3.2% among Mountain holdings and 5.9% among Hill belt holdings.

FIGURE 2.4:
SIZE DISTRIBUTION OF HOLDINGS, DEVELOPMENT
REGIONS, 2001/02

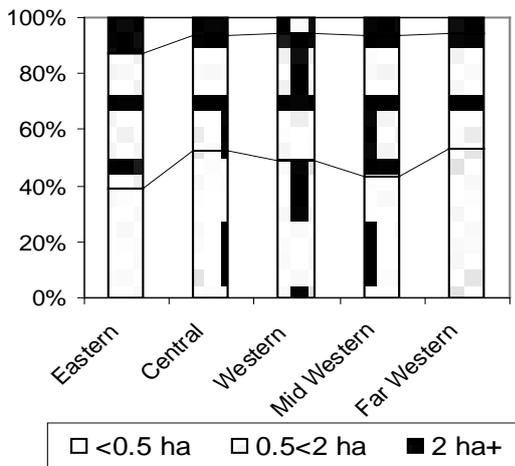

Figure 2.4 below depicts the size distribution of farm holdings in the five development regions of Nepal.

The Eastern region reported the highest proportion of holdings with at least 2 hectares in area (12.5%) followed by Central region and Mid Western region at 6.7% and 6.3% respectively. Western region and Far Western region almost have the same proportion, 5.5% and 5.4% respectively.

However, for holdings with less than one-tenth of a hectare, Eastern region reported the highest incidence of 9.4% followed closely by Central region with 8.9%. The

other three regions reported less than the national figure of 7.8%.

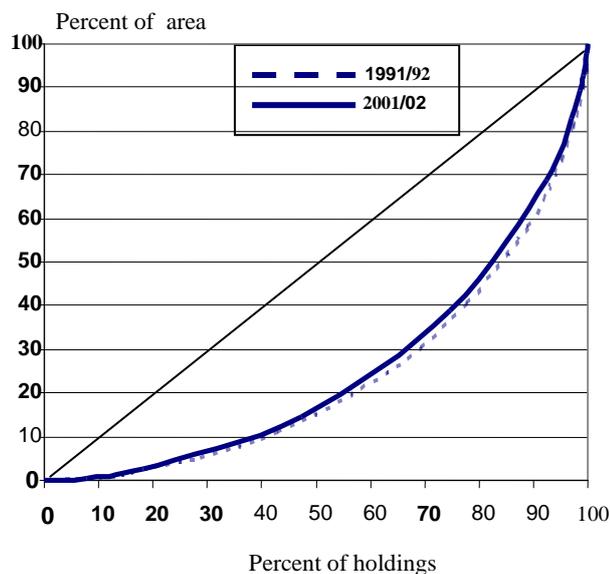

For female holders, the distribution of the size of holding shows that 62.6% reported less than 0.5 hectare compared with only 46% among the male holders with half a hectare holding. In fact, only very few among the female holders operated at least 10 hectares, but not reflected in the percentage distribution the frequency was less than 0.1%, see TABLE 2.4a.

2.4 Land distribution

The spatial distribution of land may be analyzed through the Lorenz curve and the value of the concentration index.

The Lorenz curve is a 100 x 100 graph with area equal to 10,000 units. The x axis represents the cumulative decile distribution of the area of land and the y axis represents the cumulative decile distribution of the number of holdings. If the cumulative area of the holding reported corresponds to the cumulative total number of holdings, and when plotted, the graph produces a diagonal straight line. If this is so, then we can say that there is equitable distribution of land. However, if the plotted line of the area and the number of holdings is far from the line of equity, which is the diagonal line, the value of the concentration index will help in the interpretation of the disparity in the distribution. The concentration index is the area between the Lorenz curve and the diagonal as a proportion of the total area under the diagonal. The higher the concentration index the less equitable is the land distribution.

FIGURE 2.5
LAND DISTRIBUTION, NEPAL
1991/92 AND 2001/02

The concentration index for Nepal slightly went down from 0.52 in 1991/92 to 0.49. We cannot say, however, that there was improvement in the distribution of land. Unlike between 1981/82 and 1991/92, there was a big decline from 0.65 to 0.52.

By ecological belt, a decrease in the concentration index for the three belts was observed but the decline can be said to be insignificant.

In other words, the equitable distribution of land in these three belts has not significantly improved.

Among the three belts, Tarai exhibited a concentration index of 0.53 in 2001/02 from an index of 0.54 in 1991/02. This high index can be attributed to the big share of holdings with 4 hectares and over occupying 17.1% of the total area of the holdings in Tarai compared with only 4.4% of the area shared by holdings with at least 4 hectares in Mountain belt and 3.4% of the area occupied by holdings with 4 hectares and over in Hill belt.

The situation is a little different when we look at the land distribution among the development regions. The concentration index of Central Region remained at 0.51 this means that there was no change in the land distribution among the holdings in this region.

Some improvements in the land distribution were noted in the other regions through the decrease in the concentration indexes between 1991/92 and 2001/02, as follows: Far Western Region, from 0.54 to 0.47; Mid Western Region from 0.51 to 0.45; Western Region from 0.49 to 0.45, and Eastern Region from 0.52 to 0.49.

TABLE 2.8 shows the distribution of the number of holdings, area and average farm area by development region and districts.

CHAPTER 3

LAND FRAGMENTATION

For the purpose of the agricultural census, a parcel has been defined as a piece of land physically separated from other land in the same holdings. A parcel may consist of one or more adjacent fields. The total numbers of parcels was estimated to be 10,806.0 thousand in 1991/92 and 10,974.5 thousand in 2001/02, an increase of 1.61 percent in a period of 10 years.

Number of parcels in the country does not show a particular trend. It has been going up and down from census to census. However, in a span of 40 years, that is from the first agricultural census in 1961/62 to that of 2001/02, the number of parcels have increased from 10,318.2 thousand to 10,974.5 thousand parcels, an increase of 6.4 percent. The average size of

parcel too has been changing erratically between censuses. The average parcel size was 0.16 hectares in 1961/62. It declined to 0.13 hectare in 1971/72 and then increased to 0.26 hectare in 1981/82. The average area of a parcel in 1991/92 was 0.24 hectares. It remained the same in 2001/02 also.

The average number of parcels per holding has been declining. There were 6.8 parcels per holding in 1961/62 which declined to 4.4 in 1981/82. In 1991/92 it further declined to 4.0 and finally to 3.3 in 2001/02.

The average holding size was 1.11 hectares in 1961/62. It decreased to 0.8 hectares in 2001/02.

Table 3.0 Summary Statistics

Description	1961/62	1971/72	1981/82	1991/92	2001/02
No. of holdings with land ('000)	1,518.0	1,707.3	2,185.7	2,703.9	3,337.4
Area of holdings ('000 ha)	1,685.4	1,654.0	2,463.7	2,597.4	2,653.9
Average holding size (ha)	1.11	0.97	1.13	0.96	0.80
Number of parcels ('000)	10,318.2	12,282.5	9,516.4	10,806.2	10,974.5
Average parcels/holding	6.8	7.2	4.4	4.0	3.3
Average parcel size	0.16	0.13	0.26	0.24	0.24

3.1 Number of parcels

For agriculture census purposes, a parcel in an agricultural holding is any piece of land entirely surrounded by other land, water, road, forest, or other holdings, etc. not forming part of the holding. A parcel may consist of one or more adjacent fields. The census parcel should not be confused with the term “parcel” used in cadastral survey work.

In general, land holdings become smaller in area because of the breaking up of holdings through inheritance and other factors. In Nepal, the average size of the holding has been decreasing every census year since 1961/62 but the number of parcels did not really increase considerably from 10.806 million in 1991/92 to 10.974 million parcels in 2001/02, or an increase of only 1.6% in ten years. In fact in 1961/62 the total number of parcels was only 10.318 million, an increase of only 6.4% within 40 years. Fragmentation of parcels, therefore, in Nepal is not a problem because the average size of a parcel remained the same between 1991/92 and 2001/02 at 0.24 hectare or about 2400 square meters.

Of the 10.974 million parcels of land, 5.048 parcels or about 46% were located in the Hill ecological belt; 4.724 million or 43% were in Tarai and the rest (1.203 million) representing about 11% of the total were situated in the Mountain belt.

The fragmentation of holdings by sex of holder over time cannot be measured because the available data is only for 2001/02. In 2001/02, the female holders reported a total number of 746.8 thousand parcels of land, which is 6.8% of the total parcels reported for the country. By ecological belt, female holders reported the biggest number of parcels in Hill at 501.5 thousand or 9.9% of the total parcels in the area compared with only 172.3 thousand parcels or 3.6% of the parcels in Tarai and

73 thousand or 6.1% of the total parcels in the Mountain belt.

Among development regions, Central region reported the biggest number of parcels at 3.37 million or 31% of the total and Far Western region reported the least number of 1.1 million parcels or 10.2% of the total.

3.2 Parcel size

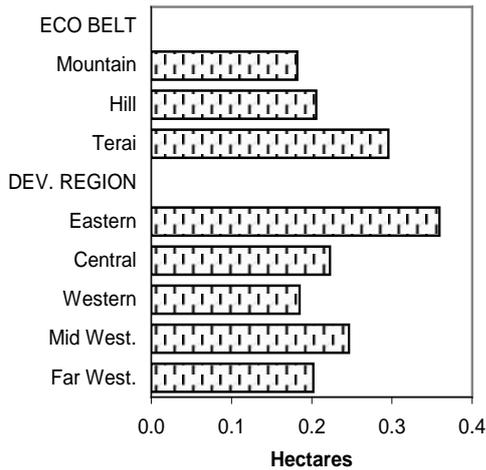

The average area of the parcel was 0.16 ha. in 1961/62, went up to 0.26 ha. in 1981/82 then reduced a little bit to 0.24 ha. in 1991/92. This average area of the parcel remained the same in 2001/02.

The small size of the parcel is understandable since farming in most part of Nepal is terrace type due to the topography of the land. This situation is reflected in the data for the ecological belts. The Mountain holdings registered the highest average number of parcel at 4 but yielded the lowest average size of 0.18 hectare or 1800 sq. m. compared with 0.21 hectare for Hill and 0.30 for Tarai belt, see Figure 3.1 below.

If we look at the parcel size of the female holding, on the national average, the area is 0.19 hectare or about 1900 square meters (sq.m.) compared with the national average parcel size for the male holding of 2500 sq.m., a female-male ratio of 76%. In other words, the average parcel size of the female holder is only three-fourths that of the size of the male holder see TABLE 3.2.

By ecological belt, the average parcel size of the female holding is a little bit smaller than the male holding in Mountain and Terai belts with a female-male ratio of 94.4% for Mountain and 93.3% for Tarai but for the Hill area, the female-male ratio was 81%.

FIGURE 3.1: AVERAGE PARCEL SIZE, 2001/02

Among development regions, Eastern region reported the largest parcel size of 0.36 hectare, which is even much higher than the national average size of 0.24 hectare followed by Mid Western region with 0.25 hectare, which is also higher than the national average. It is also interesting to note that the average parcel size of the female holding in Eastern region was reportedly the highest among female holders in Nepal at 0.31 hectare. For the same region, the male holding reported an average area of 0.36 hectare, which is also the highest average among all development regions, see TABLE 3.3.

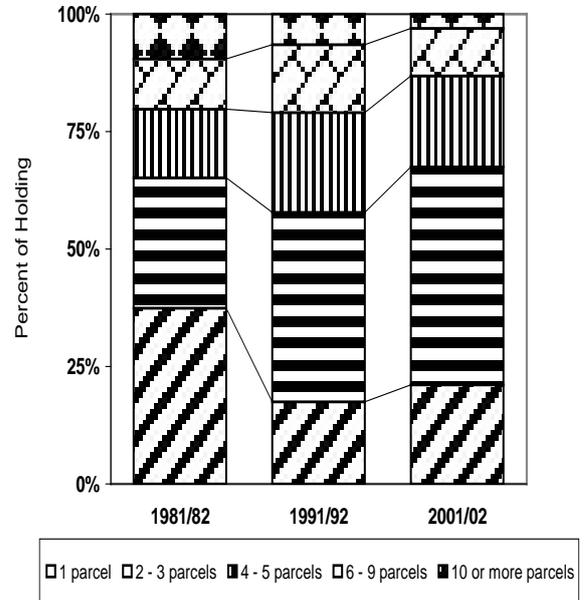

3.3 Parcels per holding

At the national level, the average number of parcels has been declining from 6.8 in 1961/62 to 4.4 in 1981/82 to 4.0 in 1991./92 and finally to 3.3 in 2001/02. The main reason for the decline in the average number of parcel was the decreasing size of the agricultural holding from 1.11 hectares in 1961/62 to 0.80 hectare in 2001/02.

Among the ecological belt, Mountain holdings reported the highest average number of parcel of 4 compared with 3.2 parcels each for Hill and Tarai holdings.

The average number of parcels per female holding is less (2.8) when compared to the male holding (3.3) with a female-male ratio of 85%. By ecological belt, the

FIGURE 3.2: NUMBER OF PARCELS PER HOLDING, NEPAL, 1981/82, 1991/91 AND 2001/02

female-male ratio of the average number of parcels is 90.6% in Hill, 82.9% in Mountain and only 66.7% in Tarai. It is in Tarai where the number of parcels per female holding is comparatively low with only two-thirds that of the male.

By development region, Western region reported the highest number of 3.9 parcels and Eastern region reported the lowest average of 2.8 parcels per holding, see TABLE 3.3. The same trend is true to both the female and male holdings where Western region reported the highest average and the Eastern region, the lowest.

3.4 Parcel number distribution

The distribution of the number of parcels for the different census years would show whether the number of parcels per holding is increasing or decreasing. The earliest available census data on the distribution of the number of parcels per holding is in 1981/82.

FIGURE 3.3: NUMBER OF PARCELS PER HOLDING, ECOLOGICAL BELTS, 2001/02

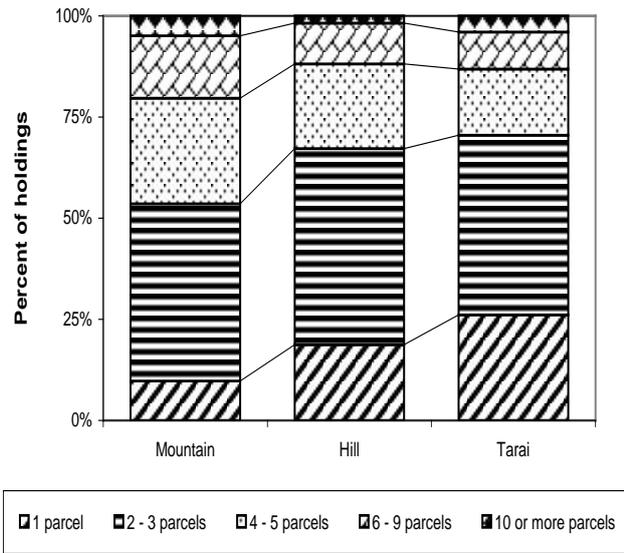

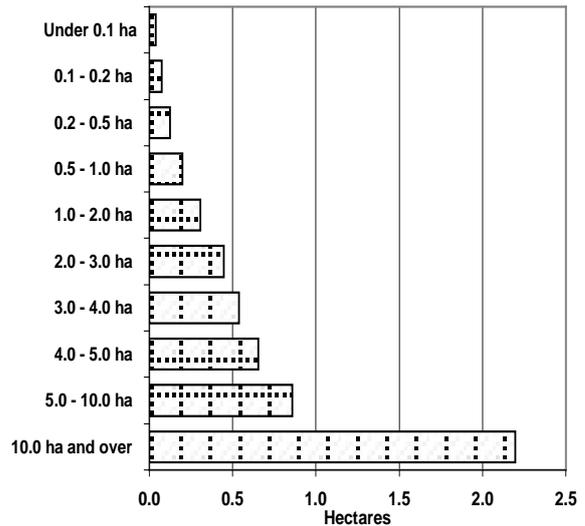

FIGURE 3.4: AVERAGE PARCEL SIZE BY SIZE OF HOLDING, NEPAL, 2001/02

For the three census years, it appears that the proportion of holding reporting 10 parcels or more in number has declined from 9.5% of the total holdings in 1981/82 to 6.5% of the total holdings in 1991/92 and only 3% of the total holdings in 2001/02. The actual number of holdings with this size also declined from 208.1 thousand in 1981/82 to 177 thousand in 1991/92, to 101.8 thousand in 2001/02.

Proportionally, there has also been a declining trend among holdings having 6 to 9 pieces of parcels of land comprising their holding, from 10.7% in 1981/82 to 14.5% in 1991/92 down to 10.2% in 2001/02. Again, there was also an actual decline in the number of holdings with 6 to 9 parcels between 1991/92 and 2001/02 from 392.5 thousand holdings to 339.0 thousand holdings, a decrease of 13.6% within a 10-year period.

The number of holdings reporting 2-3 parcels actually is on the rise from 27.8% of the total holdings in 1981/92 to 40.4% in 1991/92 and further went up to 46.3% in 2001/02. But there is an observed trend wherein the proportion of holdings with 4-5 parcels seems to be slightly decreasing between 1991/92 and 2001/02 from 21.1%

to 19.3% although the actual number is still increasing from 571.2 thousand holdings to 645.3 thousand holdings. The distribution of the number of parcels comprising the female and the male holdings follows the same direction as the national distribution.

Among ecological belts, Mountain holdings exhibited the highest percentage of holdings with at least 10 parcels of land at 4.9% of the total holdings in this belt although the actual number (14.5 thousand) is just half that of the Hill belt (28.8 thousand). Percentage-wise, it was only 1.8% of the total holdings in Hill belt, see TABLE 3.5.

Western region reported the biggest percentage of holdings reporting 10 or more parcels of land in 2001/02, which was 5.7% of the total. This is way above the national average of 3 parcels per holding.

On the other hand, Eastern region reported the lowest percentage of holdings comprising 10 or more parcels with only 1.7% of the total compared with Mid-Western region of 3.2% and Far-Western region of 2.6%. Central region reported second to the lowest percentage of 2.4%. It appears that as a whole, the more

mountainous the region is the higher is the average number of parcels.

Western region also reported the highest proportion of holdings with 6-9 parcels of land at 13.3% followed closely by Far-Western region with 13.1%. In actual number of holdings, however, Central region reported the highest with 100.8 thousand holdings against only 94.5 thousand holdings for Western region and 43.3 thousand holdings for Far-Western region, see TABLE 3.6.

3.5 Comparison of small and large holdings

At the national level, more than one-fifth (21.1%) or 705.5 thousand of the holdings reported having only one parcel of land comprising their holding. Of this number, 557.1 thousand or 79% was reported by holdings with an area of less than half a hectare while only 1.6% was reported by holdings with at least two hectares.

For 2 to 3 parcels, there were 46.3% or 1.546 million holdings reported as the number comprising their holding. Of this number, 766 thousand holdings or 49.6% belong to the holdings with less than half a hectare in area and only 4.9% or 75 thousand holdings belong to the large holdings with at least 2 hectares in area.

In essence, the smaller the area of the holding, the less number of parcels it contains. This relationship is depicted in TABLE 3.7 where, proportionally, 6 or more parcels of land were found in large holdings (37.8%) compared with only 4.5% for holdings with less than half a hectare and 17.3% with holdings from 0.5 hectare to less than 2 hectares.

The same trend is observed among female holdings where the small-sized holdings have less number of parcels than the bigger-sized holdings.

TABLE 3.8 is more revealing. As the size of the holding increases, the average number of parcels also increases. Correspondingly, the average size of the parcel also increases with the increase in the size of the holdings. It also shows that the average size of the parcels was less than a hectare even with holdings of 5 to less than 10 hectares. It is only among the very large holdings with at least 10 hectares that the average size of the parcel was reported at 2.2 hectares. This finding shows that landholdings in Nepal are composed of very small parcel sizes, thus landholding size is also small.

CHAPTER 4 LAND TENURE

Majority of agricultural holdings are operated by owners in Nepal. Out of the total 3,337.4 thousand land holdings in the country in 2001/02, 2,939.5 thousand (88.1%) holdings has only one form of tenure, i.e. either owned or rented from others or other form of tenure. Only 397.7 thousand (11.9%) holdings have more than one form of tenure, which may have some parcel owned and some parcels rented from others.

Of the total area of land holdings owned, 91.5 percent belongs to one form of tenure while 8.5 percent was part of the area under more than one form of tenure. The average size of holding under different types of tenure in 2001/02 is: one tenure form 0.76

hectares and more than one form of tenure 1.03 hectares.

The ownership of the holdings under one form of tenure is estimated to be 2,939.6 thousand in 2001/02. It is higher by 27.6 percent as compared to the previous census. But it has been observed that there was a decline in the number of holdings that rented from others by almost 25 percent - from 47.1 thousand holdings in 1991/92 to 35.5 thousand holdings in 2001/02. Similarly the number of holdings with more than one form of tenure slightly decreased from 400.6 thousand holdings to 397.9 thousand holdings, a decrease of less than 1 percent between 1991/92 and 2001/02 agriculture censuses.

Table 4.0 Summary Statistics

Type of tenure	1991/92		2001/02	
	No. of holdings ('000)	Area in ha. ('000)	No. of holdings ('000)	Area in ha. ('000)

Owned	2,239.1	2,109.5	2,896.2	2,212.8
Rented from others	47.0	36.1	35.5	26.3
Others tenure form	17.3	7.1	7.9	2.0
More than one tenure form	400.6	444.7	397.9	412.9
Owned	-	252.6	-	204.5
Rented form others	-	185.1	-	204.2
Other tenure form	-	7.0	-	4.2

4.1 Holdings by tenure

Land tenure refers to arrangements or rights under which the holder holds or uses the land of the holding. Land owned but rented out to others is not considered as part of the holding. A holding may be operated under one or more tenure forms, depending upon the tenure form of each parcel that comprises the holding.

In Nepal, while the average holding size is small, most of the holdings are owned. Of the 3.337 million land holdings, 88.1% has only one form of tenure, either owned, rented from others or other form of tenure. Only 11.9% of the holdings have more than one form of tenure, that is, one parcel may be owned and some parcels may be rented from others.

The female holder reported a higher proportion of holdings with only one form of tenure at 92.0% compared with 87.7% of the holdings among male holders.

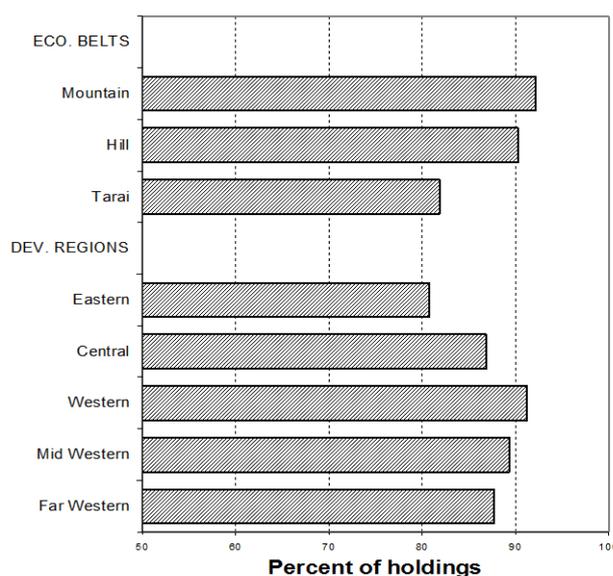

Under one form of tenure, 98.5% of the holdings owned the land with an average size of 0.76 hectare. Holdings with purely rented land comprising 1.25% of the total reported an average size of 0.74 hectare while other forms of tenure, which can either be tribal or squatter land, consisting of only 0.3% reported 0.25 hectare as the average holding size.

The same tenure form patterns, however, were observed among female as well as male holders at 98.5% owned. The only difference was that the average size of holdings owned by female holders under one form of tenure was 0.52 hectare compared with 0.79 hectare for the holdings owned by the male holders. Also for the rented holdings under one form of tenure, the female holder reported a lower average of 0.47 hectare against 0.77 hectare for the male-rented holding. It is in the "Other" form of tenure where the average size for both the female and male

holders was the same at 0.25 hectare, see TABLE 4.1.

Of the total area of landholdings owned, 91.5% belongs to one form of tenure while 8.5% was part of the area under more than one form of tenure. It was in the rented holdings where 88.6% of the total area

FIGURE 4.1: HOLDINGS WITH FULL OWNERSHIP OF LAND, 2001/02

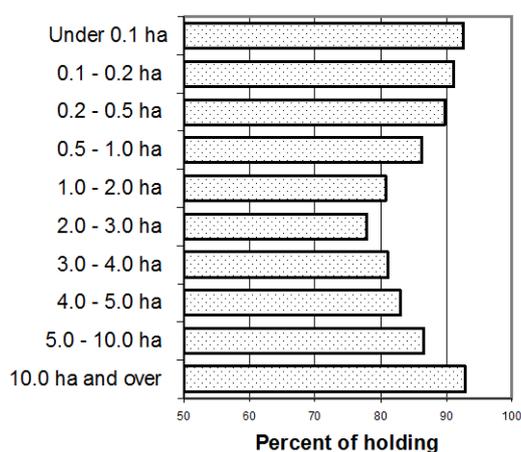

were under more than one form of tenure. The same was true for the female holdings as well as the male holdings. Only the proportions differ a little bit like 93.9% of the owned area was in one form of tenure for the female holders and 91.4% for the male holders while 6.1% of the area was under more than one form of tenure for the female holders and 8.6% for the male holders. The composition of the male holding was almost the same as the national average.

4.2 Area by tenure of land

Ownership of the area of the holding among ecological belt showed that in Tarai, only 86.8% were owned compared with higher percentages of ownership in Mountain belt at 96.7% and Hill belt at 95.7%, see TABLE 4.2.

FIGURE 4.2: HOLDINGS WITH FULL OWNERSHIP OF LAND, SIZE OF HOLDING, NEPAL, 2001/02

It is significant to observe, however, that the female holders in Tarai reported a higher proportion of ownership of land than the male holders, 90.5% for female holders and 86.7% for the male holders. In Hill belt, the female holders also reported a little bit higher proportion of ownership of land than the male holders but in the Mountain belt, the male holders have higher ownership percentage than the female holders.

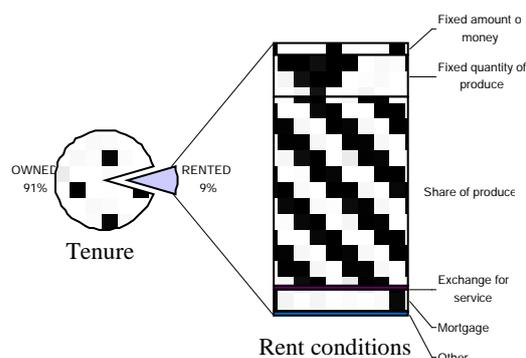

For rented land, generally, the male holders reported a higher proportion than the female holders.

The proportion of ownership of land in the five development regions was reported to be higher among the female holders than the male holders, the biggest differences were noted in Eastern and Mid-Western regions. About 91% of the female holders owned their holding compared with 85.6% among the male holders in Eastern region and about 96% of the female holders in Mid-Western region reported ownership of the land compared with only 90.3% ownership among male holders.

Like in the national pattern, the male holders reported higher proportions of rented land in all the development regions than the female holders, see TABLE 4.2.

Most holdings reported one form of tenure in all the ecological belts as well as the five development regions, the level of proportion varies not very much ranging from 83.7% in Eastern development region among the regions, and 83.9% in Tarai among the ecological belts to 91.7% in Western region and 92.6% in Mountain belt.

FIGURE 4.3: LAND TENURE, NEPAL, 2001/02 AREA OF LAND

Among the owned holdings under one form of tenure, the highest was reported also by Mountain ecological belt while Western region reported the highest proportion of ownership at 91.3% among the development regions, see TABLE 4.3

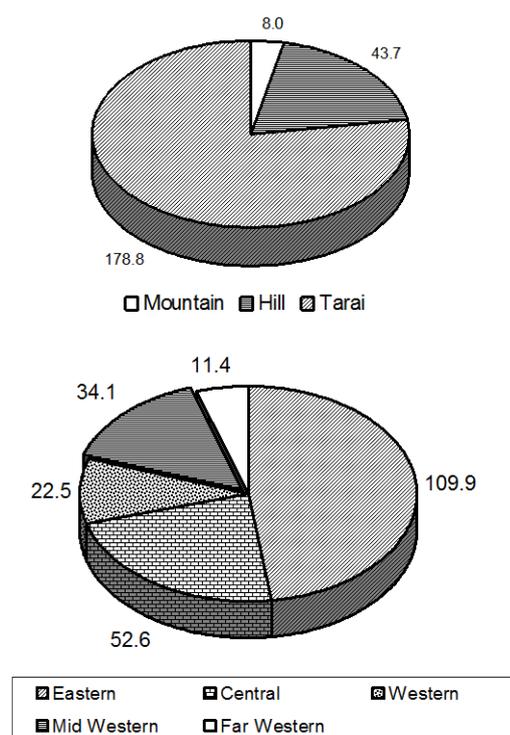

The distribution of the area of owned land by size of holdings showed that 29.2% of the owned land were found among the 1 to less than 2 hectares holding size. About 36.3% of the rented areas were also found in this holding size, see TABLE 4.4

As earlier mentioned Tarai reported the lowest proportion of ownership of land, therefore this is the belt where the incidence of tenancy is comparatively higher. In 1991/92, the proportion of holdings under more than one form of tenure was 19.2%. The figure in the 2001/02 agriculture census was 16.1%, a decrease of 3.1 percentage points. Some of these holdings and those rented holdings under one form of tenure are the tenanted

holdings either full tenants or part-owner/tenants.

There were 412.1 thousand holdings or about 12.3% of the total holdings in the country that were renting land in 2001/02. The rented land covered about 230.5 thousand hectares representing about 8.6% of the total area of land holdings in Nepal.

FIGURE 4.4: AREA OF RENTED LAND, NEPAL, 2001/02, ('000 ha)

4.3 Conditions of rent

In 1991/92 share cropping was the most common method of paying rent with 46.5% of the holding reporting such method. Share cropping involved 56.5% or 125.1 thousand hectares of the total land area being rented at that time.

In 2001/02 the proportion of sharing their produce increased to 62.2% involving a rented area of 69% of the total area being rented, which was 159 thousand hectares. Rented land with sharing of produce had

an average area of 0.62 hectare. The number of tenants sharing their produce seems to be increasing when compared to 1991/92 data while those paying a fixed amount of produce has decreased proportionally from 30.3% in 1991/92 to only 15.9% in 2001/02. Perhaps this is a better arrangement considering that it would be too risky on the part of the tenant to be paying a fixed amount of produce when no one can predict whether or not the conditions for growing crops would be better for the next cropping season.

Among the female holders, a total of 23.81 thousand had been renting land (16.6% of the total) out of a total of 143.8 female holdings. Of these renters, 57.9% of them shared also their produce as the condition of rent. The total area where they share their produce was 67.4% of the total area being rented by all female holders. The average area of the holding under sharing arrangement of produce was 0.40 hectare. The average area of rented holding for a fixed amount of money was only 0.16 hectare while the area for a fixed quantity of produce was 0.38 hectare.

The conditions of rent for the male holders follow that of the national average, see TABLE 4.6.

Of the 412.1 thousand holdings renting land 242.6 thousand or 58.9% were found in Tarai belt with 67.7% of them sharing their produce as a condition of rent. Mountain belt reported the least number of holdings renting land, only 22.2 thousand or 5.4% of the total but majority of them also share their produce as condition of their rent, see TABLE 4.7.

For the distribution of renters by development region, Eastern region reported the most number with 143.9 holdings or 34.9% of the total followed closely by Central region with 129.3 holdings or 31.4% of the total holding renting some land. Share of produce was the most common arrangement in renting

FIGURE 4.5: CONDITIONS OF RENT, ECOLOGICAL BELTS, 2001/02

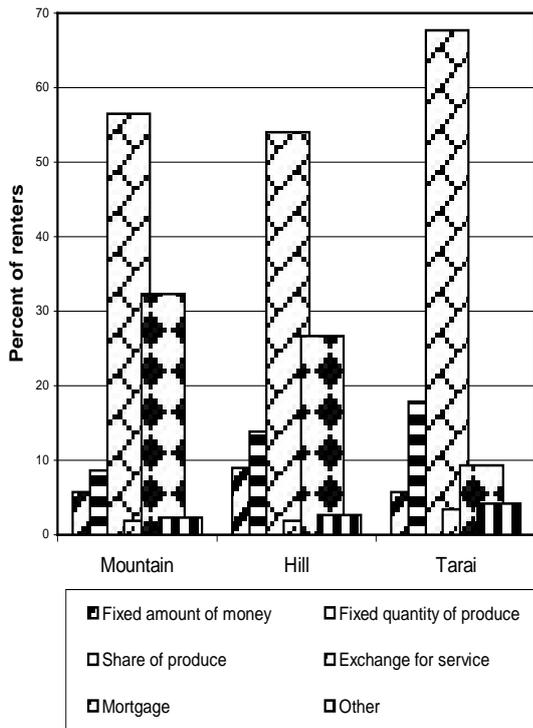

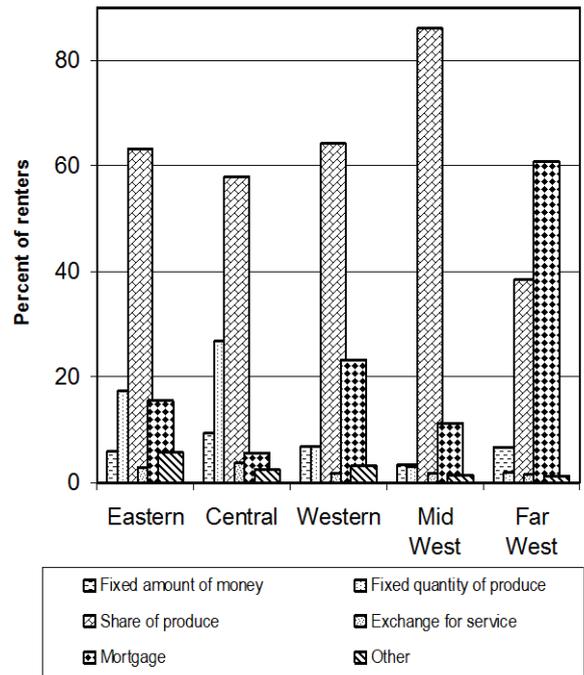

FIGURE 4.6: CONDITIONS OF RENT, DEVELOPMENT REGIONS, 2001/02

the land in Eastern region, Central Region, western region and Mid-Western region. Far-Western region was different where 60.9% of its renters reported “mortgage” as the condition of rent and only 38.4% were share crop renters.

By size of holding, share of produce is still the most popular condition of renting where about two-thirds of the holdings with sizes of 0.5 hectare to 2 hectares and over reported as condition of rent.

The proportion is much lower among holdings with less than half a hectare sharing of produce (52.4%). About 22.4% among holdings with at least 2 hectares reported “fixed quantity of produce” as the condition of rent compared with only 16.7% and 14.1% for holdings with less than half a hectare and 0.5 to less than 2 hectares, respectively, see TABLE 4.9.

TABLE 4.1: NUMBER AND AREA OF LAND HOLDINGS BY TYPE OF TENURE, AND BY SEX OF HOLDER, NEPAL, 2001/02

CHAPTER 5 LAND USE

Land use refers to the major classification of the use of the different parcels of land in the holdings. All land operated by agricultural holdings is classified as either agricultural land or non-agricultural land. The total area of all agricultural holdings in the country has been increasing.

Census 1961/62 registered an area of 1,685 thousand hectares of all agricultural holdings. In 2001/02 the area increased to 2,654 thousand hectares - an increase of 63.3 percent in the span of 40 years. In 1961/62 about 1,626 thousand hectares out of the total land operated by agricultural holding was agricultural land. This increased to 2,498 thousand hectare of agricultural land operated in 2001/02. It is an increase of 53.6 percent over the 40 years period.

The area of arable land was 1,5929 thousand hectares in 1961/62. It increased to 2,357 thousand hectares in 2001/02, an increase of 48.1 percent in forty years. It was observed that land under permanent pasture had been decreasing. In 1981/82 area under permanent pasture was 42.5 thousand hectares which decreased to 19.7 thousand hectare in 2001/02.

In the case of non-agricultural land, the area increased from 59 thousand hectares in 1961/62 to 204.5 thousand hectares in 1991/92. However, there was a sudden decrease in the area of non-agricultural land from 204.5 thousand hectares to 156.3 thousand hectares between 1991/92 and 2001/02. Arable land occupies only about 18 percent or 2,654 thousand hectares in 2001/02 of the total land area of Nepal.

Table 5.0 Summary Statistics

(Number in '000 hectares)

Description	Census year				
	1961/62	1971/72	1981/82	1991/92	2001/02
Total area of holding	1,685.4	1,654.0	2,463.7	2,597.4	2,653.9

Non agricultural land	59.0	91.7	104.5	204.5	156.3
Non agricultural land as % of total area of holding	3.5	3.7	4.2	7.9	5.9

5.1 Land use types

Land use refers to the major classification of the use of the different parcels of land in the holding. For purposes of the Agriculture Census, land operated by the holding is classified according to major land uses as agricultural land and non-agricultural land.

Agricultural lands are generally classified into two categories, the crop land and the ponds. Crop land is further classified into three categories, namely: arable land, land under permanent crops and land under permanent meadows and pastures.

On the other hand, non-agricultural lands are those lands that are part of the holding that comprise woodland or forest (not commercial) and all other land, unused and undeveloped potentially productive land and all other land in the holding not elsewhere classified including the home lot of the holder.

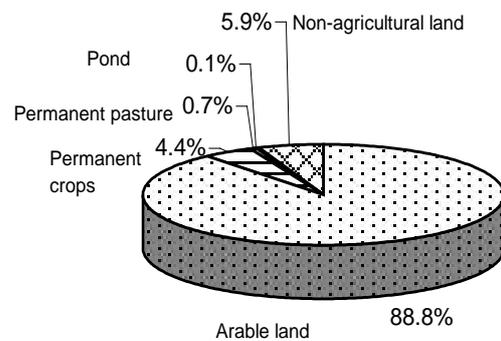

The total area of all agricultural holdings in the country had been increasing every census year from 1.6854 million hectares in 1961/62 to 2.6539 million hectares in 2001/02. Because of this increase, other major land use categories correspondingly increased in area since 1961/62. Specifically the areas of arable land and land under permanent crops have been increasing since 1961/62 up to 2001/02. On the other hand, it was observed that land under permanent pasture had been decreasing in area starting 1981/82 from 42.5 thousand hectares to only 19.7 hectares in 2001/02.

For non-agricultural land, the area had been increasing from 59 thousand hectares in 1961/62 to 204.5 thousand hectares in 1991/92. However, in 2001/02 there was a sudden decrease in the area of non-agricultural land to 156.3 thousand hectares. Probably the source of the

decrease in area is in the woodland and forest where the area abruptly decreased from 108.8 thousand hectares in 1991/92 to 37.2 thousand hectares in 2001/02, a decrease of about 66%. The plausible explanation of this decrease is the shifting of the use of the land. It is possible that some of the increase in the area of land under permanent crops may have come from this land use category.

TABLE 5.1 shows that there was a sudden increase in the land under permanent crops between 1991/92 and 2001/02 from 29.4 thousand hectares to 117.5 thousand hectares. Some of the increases may have come from non-agricultural land, some may have come from land under permanent pasture.

FIGURE 5.1: LAND USE CATEGORIES, NEPAL, 2001/02

While it was observed that there was actual increases in the area of land under the different land use categories, we can say that land use pattern in Nepal seems to be changing slowly relative to the different categories of land uses. Upon closer examination of the different land uses, there was a downward trend in the proportion of arable land relative to the total area of the holding from 94.5% of the total land holding in 1961/62 to 88.8% in 2001/02. This finding implies that while agricultural land area is steadily increasing through the years, the increase in area was not enough to maintain its relative importance to the total area of the holding.

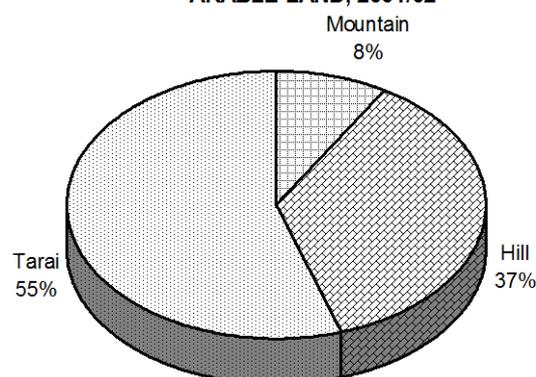

Some of the increases may have been diverted to other land uses of less importance. For instance, under the “Other land” category that belongs to non-agricultural land, the increase can be considered sizeable from 95.7 thousand hectares in 1991/92 to 119.1 thousand hectares in 2001/02 or an increase of 24.4%.

The changing pattern in land use may be seen in the percentage distribution for each census year in TABLE 5.1 where the downward trend is obvious for the arable land where land under temporary crops belongs. On the other hand, the increasing trend for the land under permanent crops is also very evident. In fact, the proportion of the land under permanent crops among female holders is extraordinarily high. This means that more female holders are engaged in tree farming, proportionally than their male counterparts.

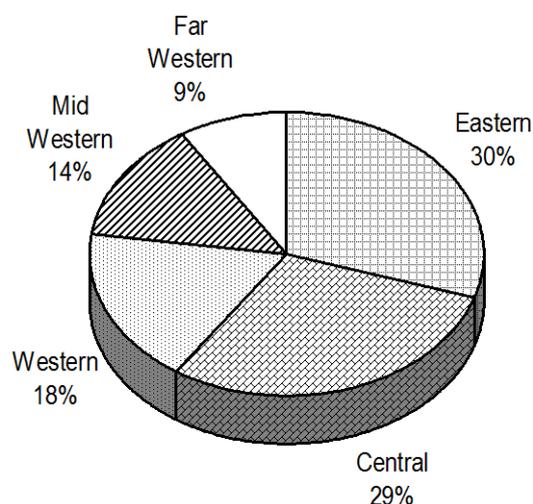

5.2 Arable land

Arable land comprises all land under cultivation to temporary crops. This type of agricultural land is very important to the attainment of food self-sufficiency in Nepal. There was a minimal increase in the area of arable land between 1991/92 and 2001/02 from 2.323 million hectares to 2.357 million hectares or an increase of 1.4% in a period of ten years. There are four categories of arable land: land under temporary crops, land under temporary meadows, land under temporarily fallow

FIGURE 5.2: DISTRIBUTION OF ARABLE LAND, 2001/02

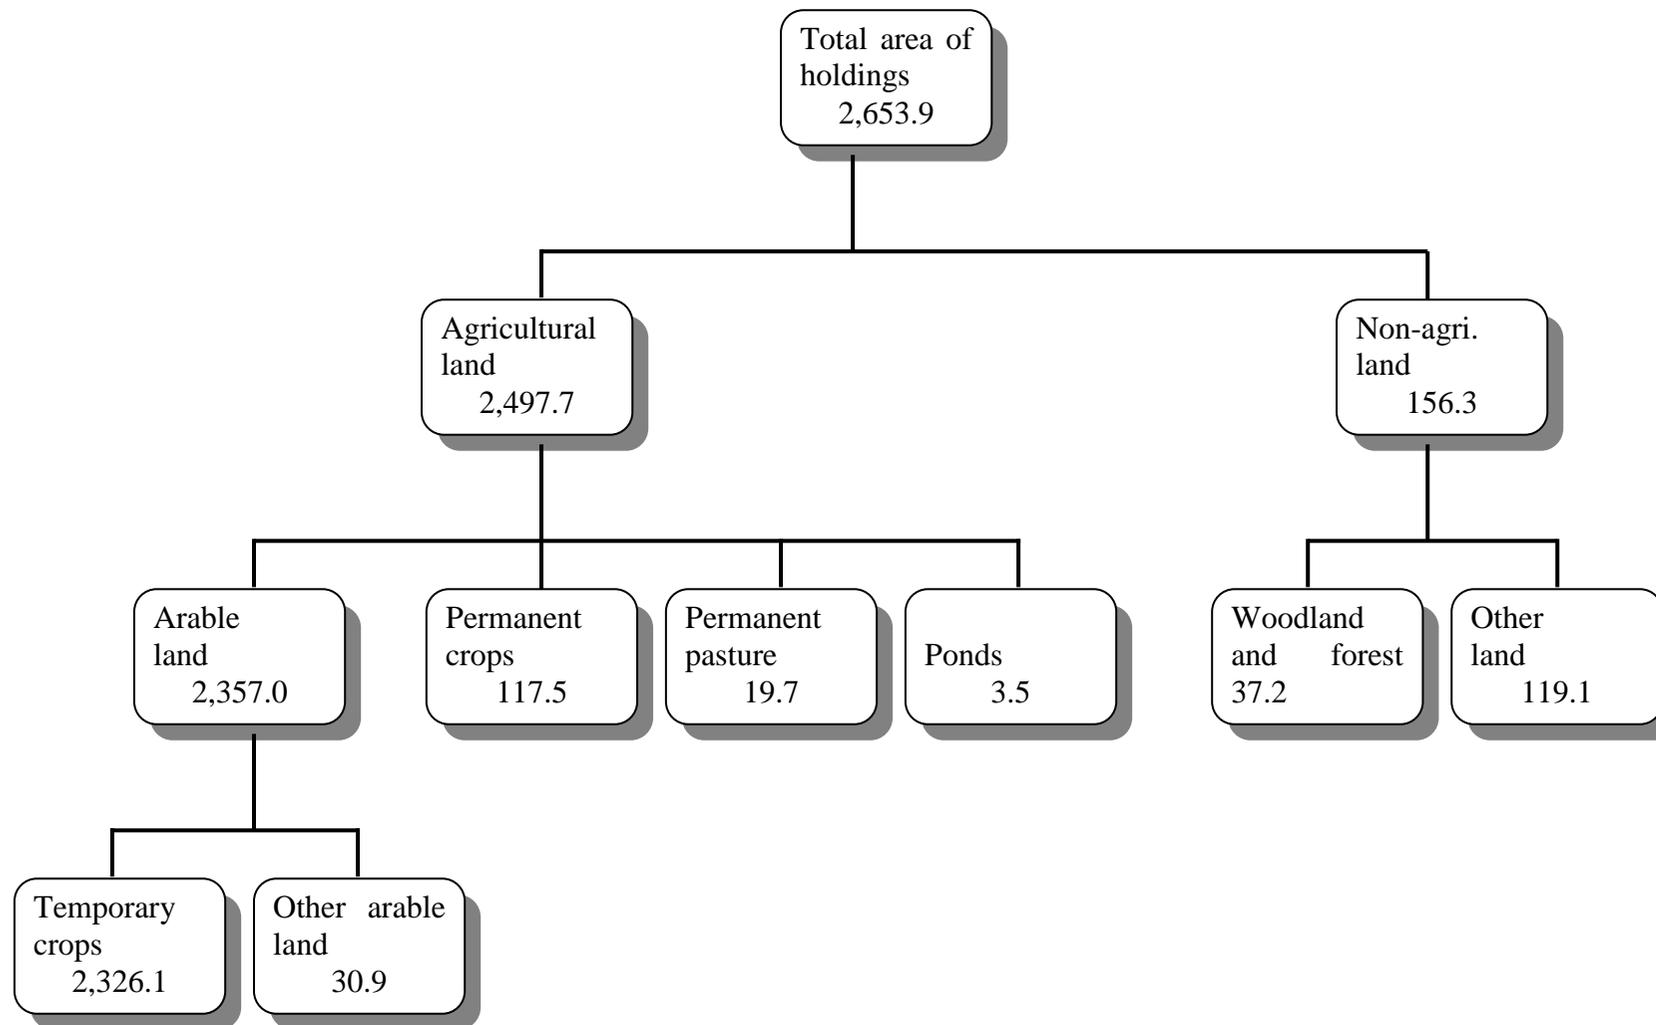

and other arable land. The land under temporary crops is considered the most important category of arable land because this is the physical area of land where annual crops were grown during the reference period. If the growing cycle of crops is for a few months only, for

example vegetables, the land can be used as many times as the growing cycle of the crop permits.

FIGURE 5.3
LAND USE, NEPAL, 2001/02
(*000 ha)

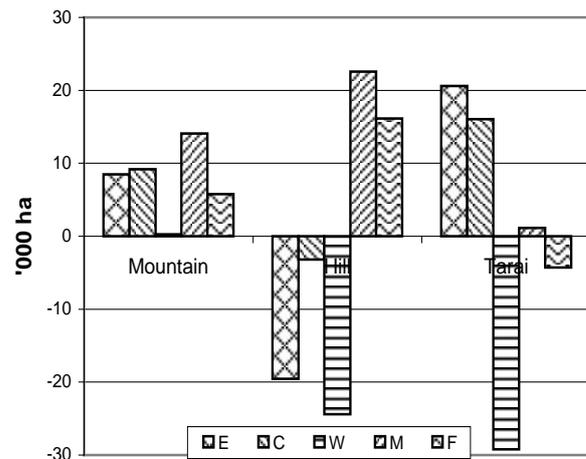

Arable land in Nepal occupies only about 16% or 2.654 million hectares of the total land area of 14.718 million hectares in 2001/02. Hill ecological belt reported the biggest land area of 6.1345 million hectares but Tarai belt reported the widest area of arable land physically and proportionally with 38% in 2001/02, see TABLE 5.2. The Mountain belt reported the lowest proportion of arable land (3.9%) relative to its total area of 5.182 million hectares, which is second largest among the three belts. The total land area of Tarai is a little more than half that of the Hill belt. This condition is expected because Tarai lies on the southern part of the country and considered as an extension of the Gangetic plains of India that normally forms a low flat land.

Moreover, Tarai belt has reported 1.294 million hectares of arable land that was 54.9% of the total area of arable land in Nepal in 2001/02. In 1991/92 Tarai had a higher proportion of arable land which was 55.5% of the total. The Hill belt also experienced a slight decrease to its position in 1991/92 from 37% to 36% in 2001/02. The Mountain belt seemed to have increased its arable land relative to the two belts where in 1991/92 the share of Mountain belt to the total arable land was only 7% and this share increased to 8.5% in 2001/02 see TABLE 5.2.

Of the 122.6 thousand hectares of arable land that female holders reported in 2001/02, Hill belt holders reported the highest proportion of arable land in relation to the total arable land in the area at 7% compared with 5.4% in Mountain and 3.3% in Tarai. Also in terms of actual arable land area, Hill belt female holders reported the biggest with 67.2 thousand hectares compared with 44.1 thousand hectares in Tarai belt and 11.2 thousand hectares in the Mountain belt see TABLE 5.2a.

The arable land operated by the female holder was only 0.83% of the total land area of Nepal. By ecological belt, the Mountain belt female holdings have only 0.22% of their arable land to the total arable land. Tarai belt and Hill belt reported higher proportions of 1.30% and 1.10%, respectively.

FIGURE 5.4: CHANGE IN ARABLE LAND, 1991/92 TO 2001/02

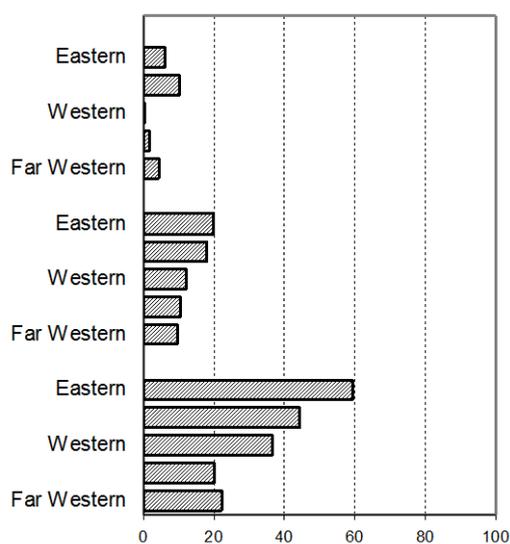

Eastern and Central development regions claim about 59.4% or 1.3995 million hectares of the total arable land of 2.347 million hectares in Nepal with Eastern region registering the biggest area of 709.2 thousand hectares followed closely by Central region with 690.3 thousand hectares. These two regions cover a total of 35 districts, 16 districts under Eastern region and 19 districts in Central region. The next largest region is Western region with 421 thousand hectares despite its coverage of 16 districts. Far-Western development region reported the least area of arable land at 206.7 thousand hectares and second to the smallest area in 2001/02 was Mid-Western region with 329.7 thousand hectares. These two regions reporting the smallest area of arable land cover also the least number of districts, 15 districts for Mid-Western region and 9 districts for Far-Western region.

The percentage of arable land to the total land area of the region explains the area of arable land found in each development region, see TABLE 5.3.

Area-wise, Mid-Western region has the largest land territory that occupies 28.8% of the total land area of the country. However, its arable land is only 7.78% of the total since most of the districts in this region are mountainous like Dolpa, Jumla, Kalikot, Mugu and Humla.

FIGURE 5.5: ARABLE LAND, 2001/02, PERCENT OF LAND AREA

Land use pattern in development regions is depicted in the percentage distribution of the different land use categories in TABLE 5.3.

Of the five developing regions, only Central region registered a proportional decrease of its total agricultural land between 1991/92 and 2001/02. However, the actual physical area of the agricultural land increased from 685.2 thousand hectares to 690.3 thousand hectares, an increase of only 0.74% (less than 1%) thus the decrease in its importance relative to other land uses.

Examining the land use structure of each developing region, it is Western region that

exhibited a low proportion of arable land of only 82.2% in 2001/02 from 83.7% in 1991/92 which was usually used in growing annual crops. However, it was this region where the proportion of land under permanent crops was highest comparatively at 10.1% compared with the next highest of 4% as reported in Eastern region. Land under permanent crops in Western region in 1991/92 was only 1% of the total area of holdings.

For female holders, the same pattern is observed in Western region that is different from the land use structure of the other four regions. The proportion of arable land reported by the female holders was only 77.5% of the 48 thousand hectares area of the holdings but the proportion of land under permanent crops registered at 12.7%. In physical terms, female holders in Western region operated 6.09 thousand hectares or about 68% of the 8.94 thousand hectares of land under permanent crops reported by all female holders in Nepal.

5.3 Percent of land for cultivation

As earlier mentioned, arable land is very important in attaining food self-sufficiency in Nepal since the land under temporary crops is under this category. The other categories of arable land are potential areas for raising crops. For instance, land under temporarily fallow, while this land is not actually cultivated during the current year, it is possible that in the next cropping year the land may be planted. Usually land under temporarily fallow is being left uncultivated during a particular year to restore the fertility of the soil or for some other reasons.

In the ecological-development region matrix shown in TABLE 5.4, all development regions under the Mountain belt increased in the area of arable land. This situation cannot be said of the regions in the two other belts. In Hill belt, three regions registered a decrease in the arable

land, namely: Eastern, Central and Western while in Tarai belt two regions registered a decrease, namely: Western and Far-Western regions. These decreases can be seen in the percentage distribution of arable land by development region cross-classified with the ecological belt.

Arable land as percent of the total land by sub-ecological belt registered an increase in the Mountain belt area from 3.1% in 1991/92 to 3.9% in 2001/02. Despite the decreasing arable land in some development regions in Tarai belt, there was still a slight improvement in the percentage of arable land to the total from 37.9% in 1991/92 to 38.0% in 2001/02. It is in the Hill belt where a slight decrease in the percentage of arable land was noted from 14.2% in 1991/91 to 14.1% in 2001/02.

Which developing regions were contributing to the increases in Mountain and Tarai belts and which of the regions were contributing to the decrease in the percentage of arable land in Hill belt, TABLE 5.5 shows the data. All regions in Mountain belt had contributed to the increase in the percentage of the area of arable land to the total land area while in Tarai belt only Eastern, Central and Mid-Western regions contributed to the increases in the area of the arable land. For Hill belt, Eastern, Central and Westerns regions contributed to the decrease in the percentage of arable land in this belt.

5.4 Land use pattern in small and large holdings

Of the 3.3374 million holdings, 3.306 million holdings reported of cultivating temporary crops. This is 99.1% of all holdings in the country of which 46.9% are found in holdings with less than half a hectare while only 10.7% are among the large-sized farms of 2 hectares and over.

The land use pattern among the small land holders for other agricultural land and woodland and forest seems to be different from the large land holder. For instance, the number of holdings with permanent crops is only 10.3% of the total while the large holdings reported 38.4% of the total as having permanent crops. Also holdings with woodland and forest comprised only 2.1% among the small-sized holdings compared with 15.4% among the large holdings. Even in the proportion of the number of holdings with ponds and permanent pasture, the small holdings are less proportionally when compared with the large holdings.

The same land use pattern was noted among the female and male holders where the number of holdings engaged in other agricultural activities and woodland and forest was much less than the large holdings, see TABLE 5.6.

5.5 Wet and dry land

Knowing whether the land is wet land or dry land is important not only to planners but also to the farmers as well.

Wet land refers to low land where water remains on the surface or on the upper soil layer, making the soil suitable for main paddy cultivation while dry land refers to any other land than the wet land; i.e. land not suitable for main paddy cultivation.

For Nepal, where it used to be a rice exporting country, knowing the proportion of wet land relative to the total land available can provide good data for planning the cultivation of rice as a main crop. The information can also provide an idea of the extent of area under irrigation both artificially and naturally. Wet land includes also lands that depend on their water supply from rainfall but adequate enough to be able to cultivate main paddy up to harvest. This kind of land has a higher water holding capacity than other

lands that enable the retention of standing water longer. The wet land is usually classified as lowland while the dry land is usually classified as upland.

Nepal has a total area of 1.6062 million hectares of wet land representing 60.5% of the total area of holdings in the country.

These wet lands are mostly found in the Tarai belt with 1.206.9 million hectares or 75.1% of the total area of wet land. Since wet land is usually found in flat terrain or areas, which is in the Tarai belt, it is not unexpected therefore that the Mountain belt and the Hill belt would yield a low proportion of wet land. For Mountain belt, its share of the wet land is only 71.8 thousand hectares or 4.5% of the total while Hill belt reported a much higher share of 327.5 thousand hectares or 20.4% of the total.

Among female holders, wet land consisted of 68.8 hectares or 47.8% of the total area of female holdings of 143.8 thousand hectares. Of this area of 68.8 thousand hectares, 39.8 thousand hectares or 57.8%

are found in Tarai; and 25.1 thousand hectares or 36.5% are in the Hill belt. Only 4 thousand hectares were found in Mountain belt, which is 5.8% of the total wet land operated by female holders.

Among the development regions, Eastern and Central regions reported the highest percentage of wet land of 65.2% and 67.1%, respectively. The aggregate area for the two regions comprised almost two-thirds of the total area of wet land in the country. Far Western region reported 59.1% proportion of wet land to the total area of holding while Mid-western reported the lowest proportion of 44.9%.

The proportion of the area of wet land relative to the total area of the holding was reported by the large holdings at 72.6% while the small holdings reported a proportion of 48.5%. The pattern is the same for the female and male holdings, except that in the case of the female holding only 60.8% of the total area are wet land compared with the proportion of 72.9% among the large-sized male holdings, see TABLE 5.8.

CHAPTER 6 TEMPORARY CROPS

Land under temporary crops has been increasing steadily. From 2,250 thousand hectares in 1981/82 it increased to 2,326 thousand hectares in 2001/02. Compared to 1981/82, the land under temporary crops increased by 34.4 thousand hectares (1.5%) in 1991/92. Likewise, the increase between 1991/92 and 2001/02 was 41.5 thousand hectares (1.8%).

The total area sown under temporary crops had increased by 23 percent between 1981/82 and 1991/92. The increase between 1991/92 and 2001/02 was comparatively low and was only 4.63 percent. Crops such as rice, maize, wheat occupy important position among the cereal crops grown in the country. And among other temporary crops legumes and oilseeds are important crops.

About 97.5 percent of the holdings reported having area under cereal crops in 2001/02.

The percentage was even higher in 1991/92 and was at 98 percent. However, the percentage of holdings that cultivated cereals grain in 1981/82 was only 78.1 percent.

Area under vegetable has increased substantially during the period between 1981/82 and 2001/02. From 17 thousand hectares in 1981/82 the area under vegetables increased to 60.0 thousand hectares in 2001/02. Unlike area under vegetable, area under cash crops, oilseeds and spices do not show a steady trend.

Cropping intensity, which gives the measures of the extent of the use of the land, shows a positive trend. The cropping intensity has increased from 1.45 in 1981/82 to 1.75 in 1991/92 and to 1.80 in 2001/02.

Oilseeds ('000 ha)	224.1	260.1	214.2
Spices ('000 ha)	58.1	29.3	40.7
Vegetables ('000 ha)	17.2	39.5	60.0

6.1 Land under temporary crops

In Nepal, the agricultural land portion of the holding is composed of arable land, land under permanent crops, land under permanent meadows and pasture and pond. Land under temporary crops is a dominant composition of arable land. As presented in Chapter 5 Land Use, land under temporary crops comprised 87.6% of the total area of the holding with a total area of 2.3261 million hectares in 2001/02. Of this number 120.5 thousand hectares or 5.2% of the total was operated by female holders while the rest belong to the male holders.

The land under temporary crop is the physical area of land where annual crops are grown. Annual crops or temporary crops are plants whose growing cycle does not exceed one year. The plants are destroyed after harvest. Some crops, however, that remain in a field for more than one year were also considered as temporary crops like sugarcane, asparagus and strawberries. Most of the annual crops that are included in the census are cereal grains, legumes, oilseeds, leafy vegetables, flower vegetables, fruit vegetables, root crops and bulbs and cash crops. TABLE 6.1 would show a listing of the major temporary crops given prominence in the 2001/02 Census of Agriculture.

In accounting for the number of times that land under temporary crops was used, the actual area planted and harvested for every crop was reported. It is possible that a parcel of land under temporary crops can be counted as many times as planted and harvested during the reference year. Thus, the cropped area would be equal to or more than the physical area of the land under temporary crops.

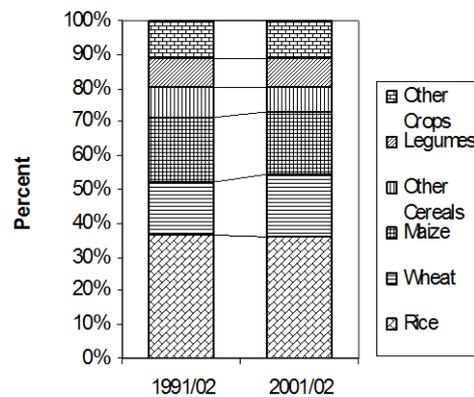

Cropped area also includes the area occupied by temporary crops planted in land under permanent crops but the area is negligible.

6.2 Composition of temporary crops

In 2001/02, out of the 3.3374 million agricultural land holdings in Nepal, 3.3054 holdings or 99.0% of the total were engaged in temporary crop cultivation. The total area cultivated to annual crops in 2001/02 was 4.2513 million hectares. This represents the cropped area out of a physical land area of 2.3261 million hectares of land under temporary crops that resulted in a utilization rate of 183.8%.

In 1991/92, out of the 2.7039 million agricultural land holdings in Nepal, 2.7019 million holdings or 99.9% of the total were engaged in the cultivation of temporary crops. The land under temporary crops in 1991/92 was 2.2846 million hectares. The

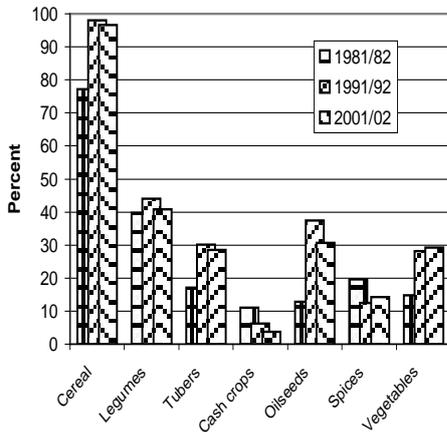

FIGURE 6.1: COMPOSITION OF CROP AREA, NEPAL, 1991/92 AND 2001/02

total area cultivated to temporary crops reported in 1991/92 was 4.063 million hectares. This is the cropped area out of a physical area of 2.2846 million hectares. The utilization rate of land under temporary crops in 1991/92 was 177.8%. In 1981/82, out of 2.1857 million agricultural land holdings, 2.1574 million or 98.7% were engaged in the cultivation of annual crops, which is almost at par with the 2001/02 proportion. The physical area of land under temporary crops was 2.2502 million hectares. The total cropped area reported on annual crops was 3.315 million hectares. The utilization rate computed for 1981/82 is 147.3%.

Based on the above findings, the 2001/02 agricultural holders utilized their land under temporary crops 83.8% more than the physical area, this means that the

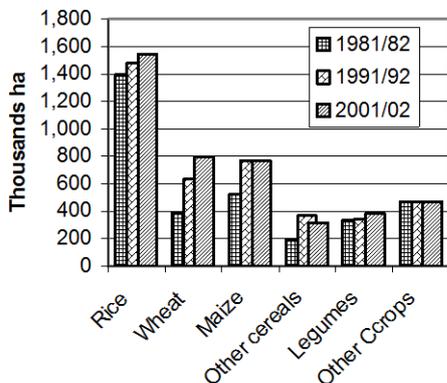

FIGURE 6.2: CROP GROWERS, NEPAL, PERCENT OF ALL HOLDINGS

holdings have practiced double cropping during the agricultural year. The 2001/02 holdings surpassed the use of the land by 6 percentage points over those in 1991/92. But what is revealing is the sudden increase in the use of the land between 1981/82 and 1991/92 where the utilization rate had increased by 30.5 percentage points. It appears that the high intensity of use of the land under temporary crops started to increase in the nineties.

There are seven major groups of temporary crops covered by the Agriculture Census,

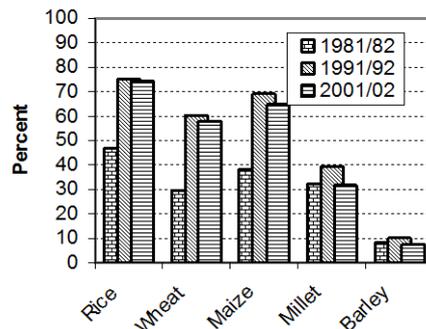

FIGURE 6.3: CROP AREAS, NEPAL

namely: cereal grains, legumes, tubers, cash crops, oilseeds, spices and vegetables.

The most common temporary crops grown was cereal grains where 97.5% of the holdings reported to have planted in 2001./02. The percentage was higher in 1991/92 at 98% although in 1981/82 the percentage of holdings that cultivated cereal grains was only 78.1%. The cropped area planted to cereal grains in 2001/02 was 3.423 million hectares which was 80.1% of the total cropped area reported for this year. The cropped area for cereal grains in 1991/92 was 3.2517 million hectares which was also 80% of the total cropped area, see TABLE 6.1. The second important group of annual crops that many holdings raised is legumes where 1.3623 million holdings or 41.2% of the total reported legumes cultivation with a total cropped area of 379.4 thousand hectares. This cropped area was 8.9% of the total cropped area reported in 2001/02.

FIGURE 6.4: CEREAL GROWERS, NEPAL, PERCENT OF ALL HOLDINGS

The third ranking group of annual crops that almost a third of the holdings raised is oilseeds with 1.0214 million holdings or 30.9% of the total holdings. The cropped area reported was only 5% of the total cropped area. Vegetables and tubers groups of crops almost shared the same number of holdings cultivating them: 978.1 thousand holdings engaged in vegetable cultivation and 950.5 thousand holdings engaged in planting tubers. The cropped area for tubers was 2.2% of the total while for vegetables only 1.4% of the total.

Spice growing was reported by 14.3% of the holdings while cash crops cultivation was engaged in only by 3.8% of the holdings in 2001/02. Cash crop growing in 1981/82 was engaged in by 11.2% of the holdings and this went down to 6.3% in 1991/92.

6.3 Rice

Rice growing in Nepal is still the most popular cereal grains cultivated by more than three-fourths of the holdings, 76.7% in 1991/92 and 77.0% in 2001/02. While the proportion is almost the same there was actually an increase in the number of holdings planting rice for all the three-season rice crops. The number of holdings engaged in planting early rice was 184.5 thousand in 1991/92 and this number increased to 193.6 thousand in 2001/02, or an increase of 4.9%; for the main rice, 1.906 million holdings in 1991/92 and increased to 2.3345 million in 2001/02 or an increase of 22.5%; and for upland rice,

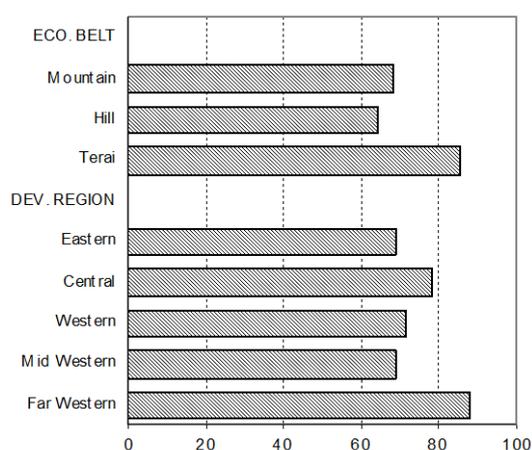

2001/02 was 2.4816 million compared with 2.0375 million in 1991/92 or an increase in the number of holdings growing rice by 21.8% within the past ten years. The total cropped area devoted to the cultivation of rice was 1.5446 million hectares which is 45.1% of the total cropped area planted to cereal grains in 2001/02. This rice cropped area is only 4.3% higher than in 1991/92.

Of the 2.4816 million holdings growing rice, 1.2627 million or 50.9% were found in the Tarai belt; 1.0156 million holdings or 40.9% were in Hill belt and the rest (203.3 thousand or 8.2%), were located in the Mountain belt, see TABLE 6.2. As a proportion to the arable land found in the ecological belt, both Tarai and Hill belts reported the highest on rice cropped area relative to the area of the arable land, which was 182.7% while Mountain belt reported 167.7%.

The arable land area in Tarai was 1.294 million hectares and in Hill belt, 863 thousand hectares. Mountain belt reported 200 thousand hectares of arable land. At the national level, the average area of rice farms in 2001/02 was 0.46 hectare that is about 36.1% of the average area under temporary crops. The average size of the holding was 0.80 hectare therefore the land devoted to rice, on the average, is about 57.5% of the holding.

Tarai belt registered the highest average 0.76 hectare on rice followed far behind by Mountain belt and Hill belt with 0.25 hectare and 0.22 hectare, respectively, see TABLE 6.4. Also in the average area sown for rice, Tarai belt reported the highest average of 0.88 hectare while that of the Mountain belt and Hill belt, 0.37 hectare and 0.35 hectare, respectively (TABLE 6.5). However, in terms of usage of rice land, on the average, Tarai holdings reported a utilization rate of 115.8% only compared with much higher average utilization rate for rice growers in

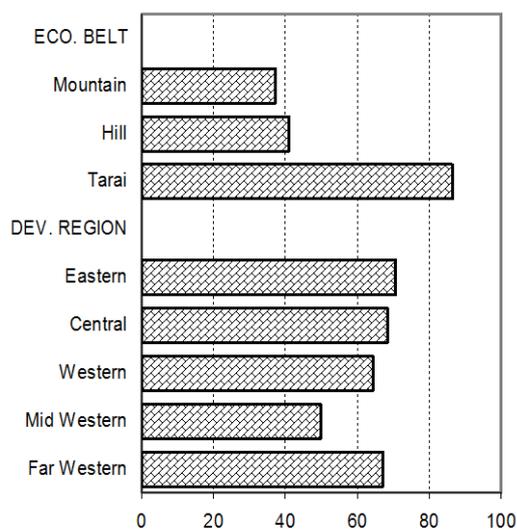

FIGURE 6.5: RICE GROWERS, 2001/02, PERCENT OF HOLDINGS

from 189.9 thousand holdings in 1991/92 to 233.1 thousand holdings in 2001/02, or an increase of 22.8%, even a little bit higher than the increase in the planting of main rice.

As a whole, the total number of holdings that were engaged in rice growing in

**FIGURE 6.6: RICE AREA, 2001/02,
PERCENT OF ARABLE LAND**

Mountain belt and Hill belt at 148.0% and 159.1%, respectively.

By development region, Central region reported the most number of holdings engaged in rice culture where 803.3 thousand or 32.4% of the total rice growers in the country. Eastern region reported 22.2% of the total rice growers while Western region had 20.6%. These three regions reported 75.2% of all rice growers in the country. The rest of the rice growers were found in Mid Western region with 13% of the total and in Far Western region, 11.8%. While Central region reported the most number of holdings growing rice, Eastern region reported the biggest area planted to rice with 500.5 thousand hectares compared with 471.0 thousand hectares found in Central region. These two regions accounted 971.5 thousand hectares of rice land or 62.9% of the total area under rice cultivation in 2001/02. Western region had 17.5% of the total rice land while Mid Western and Far Western regions reported 10.6% and 9.0%, respectively. (TABLE 6.7)

Eastern region reported the highest average of rice cropped area at 0.63 hectare, which is 40.6% of the area under temporary

crops, followed by Central region with 0.46 hectare; Far Western region with 0.42; Western region, 0.38 hectare and Mid-Western region, 0.35 hectare. The rice cropped area for the other four development regions is a little more than one-third of the total cropped area of temporary crops. When the average area sown is viewed from the holdings that were actually raising rice, the highest average was still reported by Eastern Region at 0.91 hectare followed far behind by Central region with an average of 0.59 hectare. All the other development regions reported an average sown of about half a hectare, see TABLE 6.9.

Comparatively, the proportion of holdings with less than half a hectare raising rice crop increased in 2001/02 compared with 1991/92 from 63.7% to 65.4% while the proportion of holdings raising crops in 2001/02 among holdings with area of 0.5 to less than 2 hectares stayed at par with 1991/92 but for large holdings of 2 hectares and over, there was a big decline over 1991./92 from 92.3% to 83.7% in 2001/02.

For the area planted to rice, there has been an increase to 58.7% in 2001/02 among holdings with half a hectare or less compared with only 49% of the total temporary crop areas in 1991/92. There is also an increase in the rice area of holding size 0.5 hectare to less than 2 hectares, from 58.9% in 1991/92 to 64.5% in 2001/02. The actual area increased from 649.2 thousand hectares to 824.4 thousand hectares, an increase of about 27.0%. However, among the large farms, a decrease in proportion was noted from 73.3% in 1991/92 to 70.5% in 2001/02. In actual rice area, the decline was from 704.2 thousand hectares in 1991/92 to 519.2 hectares in 2001/02, a decrease of 26.3%, see TABLE 6.11.

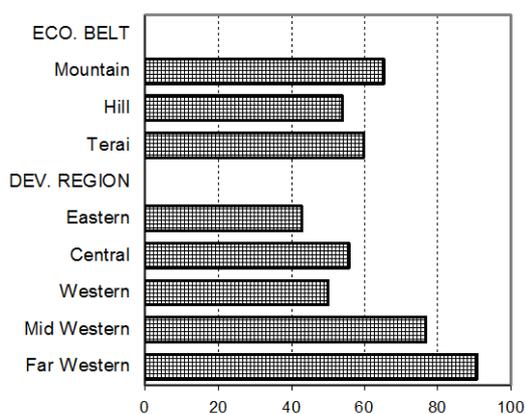

The distribution of the number of rice growers and other major cereal crops in the

different districts is shown in TABLE 6.14. Also in this table are: the average area of arable land, total area sown and average area sown by districts. The biggest rice grower in terms of area and the number of holdings is the district of Jhapa with 66.3 thousand holdings with rice in an area of 40.3 thousand hectares. However, the highest average sown was reported by Okhaldunga district at 0.62 hectare with Jhapa district following closely at 0.61 hectare. The district of Okhaldunga belongs to Eastern Hill region while Jhapa district is in Eastern Tarai. Both districts are in the eastern part of Nepal.

6.4 Wheat

Wheat is becoming an important cereal grain crop during the past two decades. In

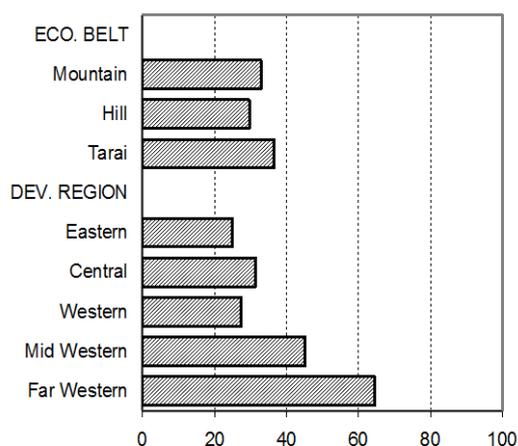

FIGURE 6.7: WHEAT GROWERS, 2001/02, PERCENT OF HOLDINGS

1981/82 there were only 649.5 thousand holdings or 38.5% of the total holdings raising temporary crops that planted wheat in a total area of 389.2 thousand hectares which is 15.5% of the total land under temporary crops. In 1991/92, there was a sudden increase of the number of holdings planting wheat to 1.9063 million, an increase of 151.9% over 1981/82 holdings. The wheat area also increased but not as much as the number of holdings but still a big increase of 63% over the 1981/82 figure. The increment in the number of

holdings and the area planted to wheat continued up to 2001/02. The number of holdings increased to 1.9351 million, an increase of 18.3% and the area planted to wheat also increase by 25.3%, from 633.1 thousand hectares in 1991/92 to 793.5 thousand hectares in 2001/02.

FIGURE 6.8: WHEAT AREA, 2001/02, PERCENT OF ARABLE LAND

As a whole, 60.1% of the total holdings in 2001/02 cultivated wheat although the total area was only 23.2% of the total cropped area under temporary crops. Of the 1.9351 holdings engaged in the propagation of wheat, 883.9 thousand or 45.7% were found in Tarai belt while 856.5 thousand or 44.3% were located in Hill belt and the rest, (194.7 thousand) were in the Mountain belt.

Among the cereal grains crops, wheat ranks second in importance in Tarai belt with 59.7% of the holdings reporting as growers while in Hill belt and Mountain belt, wheat ranks third in importance, the first two being rice and maize.

Relative to the area of arable land within the belt in proportion to the area planted to wheat, the trend is going up for all the three belts. Tarai belt registered the biggest increase proportion to the arable land from 18.8% in 1981/82 to 28.0% in 1991/92, then to 36.4% in 2001/02. There was also a big jump in the proportion of arable land

to wheat crop area in Mountain belt but this occurred between 1981/82 to 1991/92 from 13.1% in 1981/82 to 30.0% in 1991/92. However, the increase in 2001/02 was only 2.8 percentage points over the 1991/92 figure. The same trend was observed in the Hill belt where the proportion started at 14.9% in 1981/82, then increased to 25.7% in 1991/92 then to 29.7% in 2001/02.

The average area devoted to the culture of wheat is comparatively small relative to the average area planted to rice in 2001/02. Tarai belt reported the highest average size of 0.32 hectare while the Hill belt reported the least with 0.16 hectare. Mountain belt average size of wheat area was 0.22 hectare. But when the average of area sown to wheat was obtained, the average area is almost comparable to that of rice. In Tarai belt, the average area sown to wheat was 0.53 hectare, 0.36 hectare in Hill belt and 0.34 hectare in the Mountain belt. The distribution of the holdings that raise wheat by development region showed that Central Region got the biggest number of wheat growers (572.1 thousand) which is 29.6% of the total while the rest of the four regions almost equally shared in the rest of the holdings ranging from 302 thousand in Far Western region to 361 thousand in Mid-Western region, see TABLE 6.6.

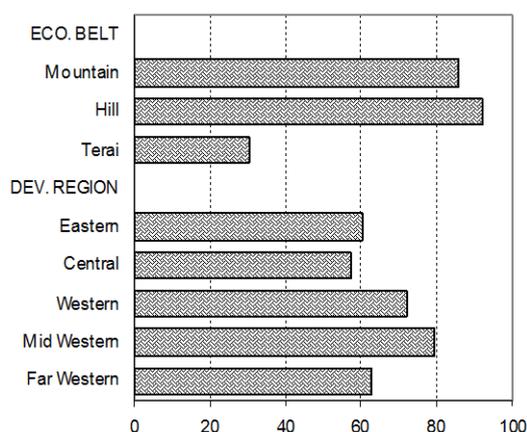

Of the 793.5 thousand hectares planted to wheat, 217.8 thousand hectares are located in Central region, which is 27.4% of the total. The second biggest area of wheat was found in Eastern region with 177.5 thousand hectares or 22.4% of the total. Almost half of the total wheat crop area was shared by the three regions as follows: 148.7 thousand or 18.7% for Mid-Western region; 133.6 thousand hectares or 16.8% for Far-Western region and 116 thousand hectares or 14.6% for Western region.

The area devoted to wheat growing in Far-Western region ranks almost equally with

rice where about 65% of the cropped areas under temporary crops were planted to wheat compared with 67% of the area under temporary crops was used in rice growing. In the other four regions, only about one-fourth of the area under temporary crops was utilized for wheat growing.

Most of the wheat growers belong to holding size of 0.5 to less than 2 hectares with 988.8 thousand holdings representing about 51% of all wheat growers. Only 194.7 thousand holdings belong to the large holding group of at least 2 hectares while the rest (751.6

FIGURE 6.9: MAIZE GROWERS, 2001/02, PERCENT OF HOLDINGS

thousand), belong to the holding size of less than half a hectare, see TABLE 10.

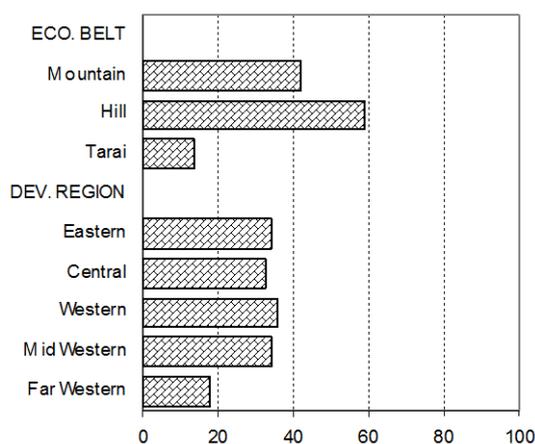

The area planted to wheat is only about one-third of the area of arable land for all the different sizes of the holding, see TABLE 6.11.

The biggest wheat growers reported among districts are those of the districts of Rupandehi and Kailali with 58.3 thousand each followed by Accham district with 41.4 thousand wheat growers. On the highest average size of wheat cropping area, the district of Bardiya reported the highest at 0.67 hectare followed by Kailali with 0.65 hectare.

6.5 Maize

Maize cultivation is second in importance to rice growing both in the number of holdings and the area planted to it. In 2001/02, there were 2.1663 million holdings that reported the cultivation of maize. This number represents 67.2% of the total holdings with land under temporary crops. The total crop area devoted to maize was 769.4 thousand hectares in 2001/02 which is 22.5% of the total cropped area in the same year. In 1991/92 the cropped area reported on maize was a little less at 768.7 thousand

**FIGURE 6.10: MAIZE AREA, 2001/02,
PERCENT OF ARABLE LAND**

hectares, a difference of only 700 hectares. In short, the area devoted to maize has not improved within the last ten years.

Most of the maize growers were found in the Hill belt where 1.4618 million or 67.5% of the total maize growers were found. Within the Hill belt, maize growers comprised 92.1% of the total holdings raising temporary crops. Tarai reported a total of 448.3 thousand maize growers which is only 30.3% of the total holdings with temporary crops within Tarai belt but 20.7% of the total maize growers in Nepal while the Mountain belt reported 256.2 thousand maize growers which is 11.8% of the total holdings raising maize. However, within the belt area, the proportion of

maize growers to the total holdings with temporary crop was 85.9%, see Figure 6.9.

At the national level, the total area planted to maize is only 32.6% of the total area of arable land in 2001/02, a slight decrease when compared with the proportion in 1991/92 which was 33.1% although the area cultivated to maize did not decrease.

However, if we examine the proportion of maize area to the arable land within the belt, Tarai belt reported a very small proportion of 13.5% area of maize relative to the total arable land of 1.294 million hectares. In contrast, the Hill belt reported the highest proportion of maize area relative to the arable land at 59.1% while the Mountain belt reported 42.0%. In fact, in these two belts, maize is the most important crop area-wise. Rice is only second in importance according to the area devoted to the crop.

Central development region reported the most number of maize growers with 586.7 thousand that is equivalent to 27.1% of the total maize growers in the country. The second highest number of maize growers was found in Western region with 516.2 thousand holdings or 23.8% of the total. Eastern region reported 22.2% of the total Mid-Western region and Far Western region had 17.2% and 9.4%, respectively.

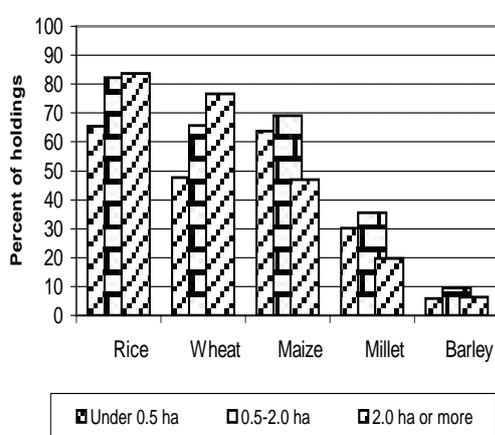

Of the 769.4 thousand hectares planted to maize, 30.5% were in Eastern region; 28.6% in Central region; 19.0% in Western region; 14.1% in Mid-western region; and 4.7% in Far Western region, see TABLE 6.7. Eastern region reported the highest average cropped area planted to maize at 0.30 hectare while the lowest average was reported by Far-Western region at 0.11 hectare. (TABLE 6.8). More than a million maize growers have holding size of less than half a hectare and another million maize growers reported their holding size between half a hectare and less than 2 hectares. Only 119.6 thousand maize

holdings belong to the large holding category. This is only 5.5% of the total maize holdings but they control 16.9% of the total area planted to maize.

6.6 Other cereal grains

The other cereal grains that are important in farming are millet, barley and buckwheat. In 2001/02, however, it was

FIGURE 6.11: CEREAL PRODUCERS BY SIZE OF HOLDING, NEPAL, 2001/02

observed that the number of holdings engaged in the production of millet and barley has decreased slightly. Because of the decrease, it may have affected the area planted to these two cereal grain crops. In millet for instance, there were 1.065 million holdings that planted this crop, which is 40.2% of the total holdings engaged in temporary crop farming in 1991/92.

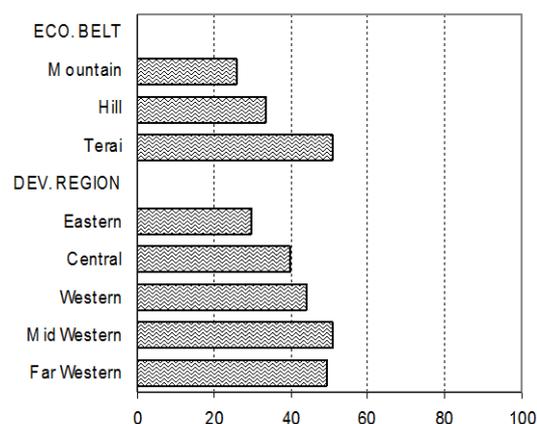

In 2001/02, the number decreased to 1.060 million holdings that resulted in the percentage of only 32.9% of the total. There was also a corresponding decrease in the area planted to millet from 301.5 thousand hectares in 1991/92 to 250.5 thousand hectares in 2001/02, a decrease of 16.9%. In the case of barley, there was also a decrease in the number of holdings planting this cereal. In 1991/92 there were 279.3 thousand holdings planting barley. This number decreased to 251 thousand or a decrease of 10.1%.

Buckwheat growing seems to have improved during the past ten years. In 1991/92 the total number of holdings engaged in the raising of buckwheat was 95.5 thousand. This number increased to 111.4 thousand, an increase of 16.6%. The area also increased from 16.3 thousand hectares to 20.8 thousand hectares, an increase of 27.6%.

6.7 Legumes

The cultivation of legumes was the second most important group of temporary crops raised by the holdings. In 2001/02, 1.3623 million holdings reported of having planted some kind of leguminous plants in their holding which comprised about 41.2% of all the holdings in the country

FIGURE 6.12: LEGUME GROWERS, 2001/02, PERCENT OF HOLDINGS

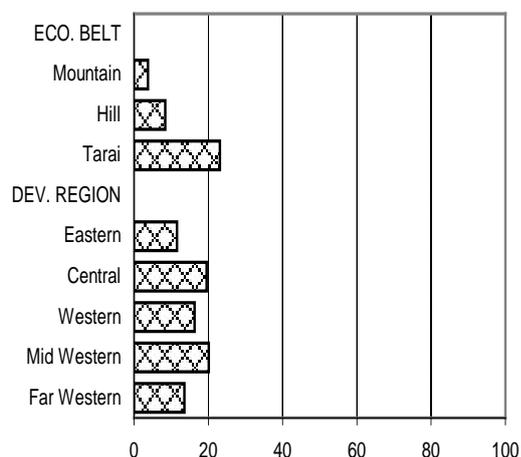

engaged in the cultivation of temporary crops. This percentage actually decreased when compared with 1991/92 where the percentage of holdings engaged in legumes cultivation was 44.1% of the total. However, the actual number of holdings did not decrease. In fact there was even an increase from 1.1916 million holdings in 1991/92 to 1.3623 million holdings with an increase of 14.3%.

The biggest number of holdings cultivating a particular kind of legume are those planting lentils with 756.1 thousand or 55.5% of the total holdings engaged in the

cultivation of legumes in 2001/02. The next biggest group composed of 257.2 thousand are holdings planting soybeans. Black grams, peas and cow pea cultivation was reported by about 170 thousand holdings each.

The area planted to legumes increased from 340.4 thousand hectares in 1991/92 to 379.4 thousand hectares in 2001/02, an increase of 11.5%. Among the legumes, lentils consisted of 62.4% of the total areas planted to legumes in 2001/02. This crop used to occupy only 47.2% of the total area devoted to legumes in 1991/92. The second important legume in terms of area planted is grass pea with 25.5 thousand hectares. Tarai belt reported the most number of holdings engaged in plating legumes with a total of 750.6 thousand which is 55.1% of the total legumes growers, while the hill belt reported 534.9 holdings or 39.3% of the total, see TABLE 6.2.

FIGURE 6.13: LEGUMES AREA, 2001/02, PERCENT OF ARABLE LAND

Of the 379.4 thousand hectares planted to legumes, 299.6 thousand hectares or about 79.0% of the total. This area represents 23.1% of the total arable land in Tarai belt. The area devoted to legumes in Hill Belt, which was 72.3 thousand hectares was only 8.4% of the total arable land in the

belt. The least percentage was reported by Mountain belt with only 3.8% of the total arable land in the belt planted to legumes.

6.8 Tubers

Tubers group is another group of temporary crops that are equally important to the diet of the Nepalese people. This crop is grown all over Nepal but in small scale. The average area planted was only one-tenth of a hectare, which can be considered as subsistence type of farming. In 2001/02 there were 950.1 thousand holdings raising any kind of tubers, most of which are planting potatoes both during winter and summer. The tuber growers comprise about 28.7% of all holdings engaged in raising temporary crops in 2001/02. The area used in raising tubers, however, is comparatively small in size where only 2.2% of the total areas planted to temporary crops were planted. About 91% of these area were planted with potatoes, both winter and summer potatoes.

6.9 Cash Crops

Cash crops for the census of agriculture purposes are non-food crops that can provide immediate cash income to the farmer since these crops are not for table consumption of the family.

However, it is noted that, in general, the number of holdings engaged in raising cash crops has been declining through the years. The number of holdings raising any of these cash crops and corresponding area being cultivated to jute, tobacco and other cash crops has been declining fast during the past 20 years. However, the trend for sugar cane seems to be increasing both in number of holdings raising it and the area cultivated. As a whole, there were only 124.6 thousand holdings engaged growing cash crops involving a total gross area of 60.6 thousand hectares in 2001/02. Most of these holdings (68.3%) were engaged in

planting sugarcane which took 85.7% (or 51.9 thousand hectares out of 60.6 thousand hectares) of the total area planted to cash crops. Of the 124.6 thousand holdings engaged in cash crop farming, 100.4 thousand or 80.6% were found in Tarai belt in the central and eastern part, although some were also found in the western, mid-western, far western part of Tarai. Only 5.5 thousand holdings were found in the mountain belt area and 18.7 thousand in the Hill belt, see TABLE 6.2. Correspondingly, most of the areas belt with 58.8 thousand hectares representing 97% of the total area.

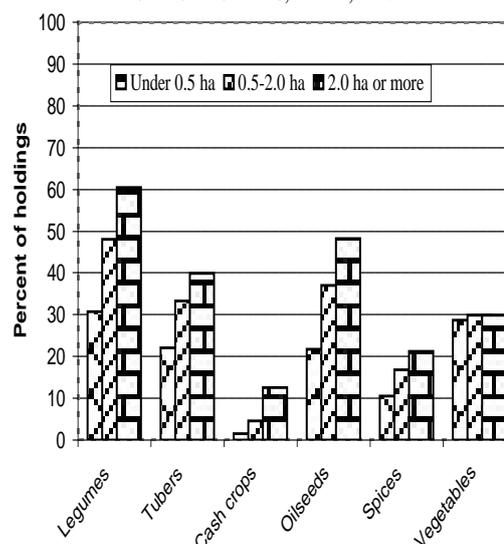

6.10 Oilseeds

There were 1.0214 million holdings representing 30.9% of total holdings cultivating temporary crops that reported in the growing of oilseeds of only 214.2 thousand hectares or 5% of the total cropped area in 2001/02. The number of holdings increased by less than 1% over the last ten years but the area planted to oilseeds declined by 17.6% during the same period. These declines were observed in the planting of mustard and linseed both in the number of holdings and the area planted to these two crops. The gains were posted in the groundnut and other oilseeds both in the number of holdings and area although, comparatively speaking, the number of holdings and the area devoted to these crops do not even add up to 5% of the total oilseeds.

Looking back twenty years ago, there was actually a spurt increase in the number of holdings growing oilseeds by 260.1% between 1981/82 and 1991/92, see TABLE 6.1b. This may be the reason for the minimal increase in the number of holdings growing oilseeds in the last ten years (between 1991/92 and 2001/02).

While the trend had declined between 1991/92 and 2001/02, mustard and linseed crops are still the major oilseed crops in

FIGURE 6.14: CROP GROWERS, NON-CEREAL CROPS BY SIZE OF HOLDING, NEPAL, 2001/02

Nepal. Sesame crop is also on the decline although its importance to the whole oilseed group is only 2.2% of the total cropped area for this group.

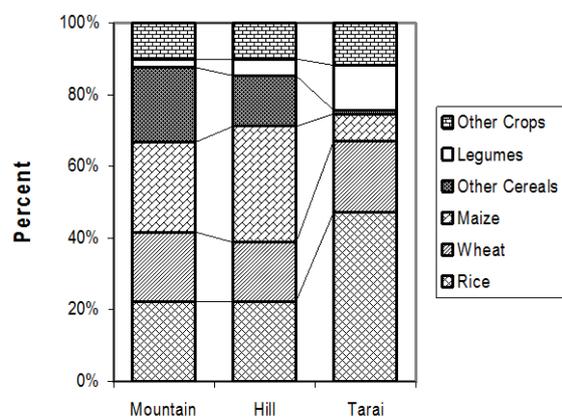

Most oilseed growers are located in Tarai (52.9%) and Hill belts (44.2%) and spread all over the different development regions. It is noted, however, that the number of holdings engaged in the growing of oilseeds in Eastern and Central regions was declining during the last ten years but the opposite is observed in the three other regions, namely: Western, Mid-western and Far Western regions, where the number of holders growing oilseeds had increased during the same period but only the area planted to oilseeds in Mid Western region had increased while that of Western region remained the same and Far Western region decreased by about half (from 28.2 thousand hectares in 1991/92 to 15.5 thousand hectares in 2001/02), see TABLE 6.7.

6.11 Spices

Spices as a group of crops is not considered a major crop for planting among holdings but certainly it is an important crop to the table of the Nepalese. In 2001/02 only 14.3% of the totals

holding raising temporary crops were engaged in spices growing in a very small

FIGURE 6.15: COMPOSITION OF CROP AREA, ECOLOGICAL BELTS, 2001/02

aggregate area of 40.7 thousand hectares which is only 1% of the total cropped area.

It is noted that there was an increase in the number of holdings growing spices between 1991/92 and 2001/02 from 336.4 thousand in 1991/92 to 473.7 thousand, an increase of 40.8%. Twenty years ago, the number of growers of this crop decreased by 21.3%. It was also noted that there was an increase of 38.9% in the total cropped area planted, from 29.3 thousand hectares to 40.7 thousand hectare between 1991/92 and 2001/02. Of the 473.7 thousand holdings engaged in growing spices, almost half of them (49%) were found in the Hill belt, 43.2% in Tarai belt and only 7.7% were in Mountain belt. The spice growers were spread across all regions with Eastern region reporting the biggest number of 144.4 thousand holdings.

6.12 Vegetables

Different kinds of vegetables are a common commodity in the diet of the Nepalese especially those who are vegetarian by choice. In Nepal, growing vegetables is not as lucrative as growing rice, which is a prime commodity in the food basket of a family. In 2001/02, the number of vegetable growers has not really

increased proportionally relative to other temporary crops in the last ten years having registered a proportion of 29.6% in 2001/02 compared with 28.2% in 1991/92. However, if we examine its growth as a group, the number of holdings raising vegetables had increased by 28.2% in the last ten years, from 763.1 thousand holdings to 978.1 thousand holdings in 2001/02. The area used in growing vegetables also increased by 51.9% in the last ten years (see TABLE 6.1b) although proportionally with other crops, vegetable growing shares only 1.4% of the total area under temporary crops in 2001/02, see TABLE 6.1

Majority of the holdings growing vegetables are found in Hill belt composed of 53.1% (518.9 thousand) of the total growers but a significant number (387.6 thousand) are found in Tarai belt.

In terms of area planted to vegetables, however, Tarai belt reported the most, which was 30.2 thousand hectares or a little more than half of the total crop area planted to vegetables in Nepal. The Mountain belt grows only an area of 3.7 thousand hectares.

The average area of vegetable crop was only 200 square meters for the country, which is the same size found in Hill and Tarai belts. Mountain vegetable garden is, on the average, only about 100 square meters. At the national level, the average area sown for vegetable crops in 2001/02 was 600 square meters or 0.06 hectare. Tarai belt exhibited the highest average of 800 square meters, an average use of the land 4 times a year compared with only 500 square meters each for the Hill belt and Mountain belt holdings, see Table 6.5. However, in terms of rate of usage of the vegetable area, the Mountain belt holdings reported the highest at 500%, followed by Tarai belt holdings with 400%. Hill belt holdings reported the lowest utilization rate of 250%. There may be a reason for

this low utilization rate in Hill belt. The holdings may have grown the long-maturing type of vegetables like asparagus and the like.

Vegetable growing holdings are spread all over the different development regions with the greatest number found in Central Western and Eastern regions and the least number in Far Western and Mid Western regions, see TABLE 6.6.

6.13 Cropping practices

Of the 3,364,139 holdings in Nepal, which include holdings with no land, 3,255,811 holdings cultivated temporary crops as a single crop or pure stand crop involving 3,990.4 million hectares. The actual physical area under temporary crops based on the land use classification in 2001/02 was 2.32612 million hectares. An indication of the double cropping, that is planting one crop in two or more cropping seasons, can be seen by the difference of the sown area and the physical area considering that mixed cropping is negligible. Based on the data on hand, there was 1.66428 million hectares double cropped in Nepal that is approximately 71.5% of the total physical area of land under temporary crops.

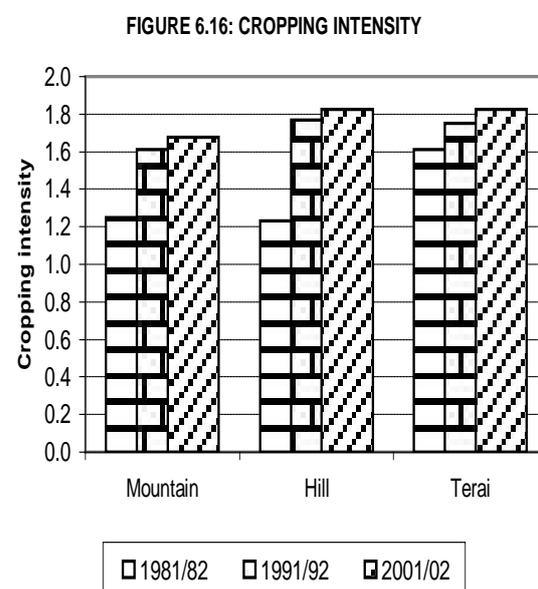

Mixed cropping or inter-planting of temporary crops and/or permanent crops with temporary crops is not a common practice among farmers in Nepal. In 2001/02, 667.1 holdings or 20% of the total holdings raising temporary crops practiced mixed cropping in an area of only 6.1% of the total area of temporary crops sown, see TABLE 6.15.

6.14 Cropping intensity

Cropping intensity measures the extent of the use of the land. There are two measures usually used, namely: the ratio of the area sown to temporary crops to the

total arable land, and the ratio of the area sown to temporary crops to the total physical area of land under temporary crops.

The first ratio is a gross ratio because it includes land under temporarily fallow, temporary pastures and other arable land that were not actually utilized during the reference year. These are potential croplands. The second ratio provides the actual use of the same land as many times as it was used during the reference year,

thus providing the actual intensity use of the land.

The graph below depicts the extent of the use of the land in the three ecological belts. TABLE 6.16 shows the comparative cropping intensities by ecological belt.

In 2001/02 Far Western and Central regions exhibited the highest cropping intensity of land use at 1.92 and 1.88, respectively.

By size of holding, those with half a hectare reported the highest cropping intensity of 2.04 compared with 1.65 only for large farms, see TABLE 6.18.

CHAPTER 7 PERMANENT CROPS

Permanent crops are long-term crops which do not have to be replanted for several years after each harvest. As per the definition, permanent crops in Agriculture census 2001/02 cover all fruit trees together with tea and some other crops such as thatches, fodder trees and bamboos.

Permanent crops are grown either in compact plantation or scattered in the residential plot of agricultural holders. There is an increasing trend in the number of holdings reporting permanent crops over the years. The decade between 1981/82 and 1991/92 recorded a large increase in the number of holdings reporting permanent crops. The increase in the number of holdings reporting permanent crops between these two censuses was 48.6 percent. The decade between the census year 1991/92 and

2001/02 recorded an increase of 3.3 percent only.

The number of holdings with permanent crops having compact plantation in 1981/82 was 148.5 thousand. This increased to 281.4 thousand holdings in 1991/92 and to 429.5 thousand holdings in 2001/02. The number of holdings reporting compact plantation are far too few compared to those reporting scattered permanent plants. Area under compact plantation does not show much increment. Over the last three censuses (1981/82 – 2001/02) area under compact plantation has increased by 14 percent only.

Among fruits, mango is the most common with 565.0 thousand holdings (about 42 percent of the total holdings) reporting in 2001/02. Mango is followed by banana with 467 thousand holdings reporting it.

Table 7.0 Summary Statistics

(In thousand except percent and average area)

Description	Census year		
	1981/82	1991/92	2001/02
Holdings with permanent crops	329.2	1,314.5	1,356.9
Percent of land holdings	15.1	48.6	40.7

Compact area in ha	29.1	29.4	33.2
Ave. compact area per holding in ha	0.1960	0.1045	0.0774

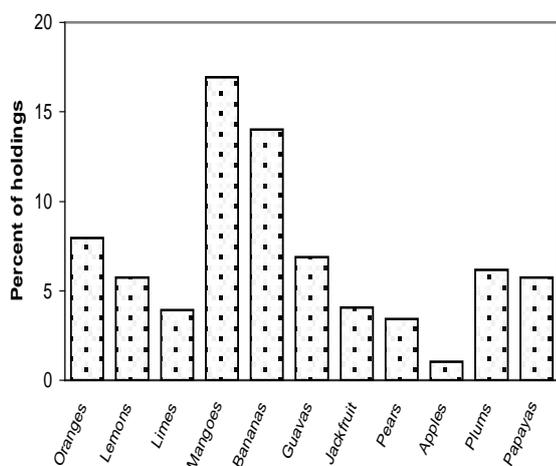

7.1 Permanent crops grown

Permanent crops are crops with a growing cycle of more than one year. For purposes of the 2001/02 Agriculture census, permanent crops cover all fruit trees, together with tea and some other permanent crops such as thatches, fodder trees and bamboos.

The most common or popular fruit tree grown in 2001/02 in 565 thousand holdings or about 42% of the total holding with permanent crops was mango. The second fruit tree most popular was banana with 467.1 thousand holdings growing them and the third most common fruit trees were oranges with 265.9 thousand holdings reporting as having them in their holding. Other fruit trees where significant numbers of holdings were reportedly growing them in 2001/02 are: guavas, plums, lemons, papayas, limes and pears, see TABLE 7.3.

In terms of the number of trees, bananas topped the list with 6.3 million of which about 3 million were found in compact plantations with an area of only 3,140 hectares. Second, were mango trees with a

FIGURE 7.1: HOLDINGS WITH PERMANENT CROPS, TYPE OF CROP, NEPAL, 2001/02

total of 4.2 million of which 2.6 million were in compact plantation with an aggregate area of 18.5 thousand hectares.

The third highest number of trees was oranges with 2.8 million trees of which 1.7 were in compact plantations in an area of 3200 hectares. All the other fruit trees such as plum, lemon, apple, pineapple, guavas, papaya, lychee, pear, lime, etc., are less than a million in number, see TABLE 7.9.

7.2 Compact and scattered crops

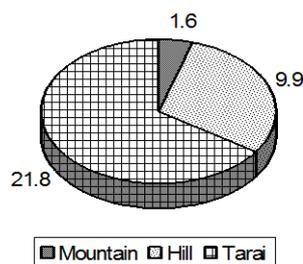

Permanent crops are either grown in compact plantations or scattered in backyards usually along fences that border the residential lot of agricultural holders. In 2001/02, the number of holdings with permanent crops totaled 1.356.9 million. This number represents 40.7% of the total land holdings in Nepal. Of this number, 429.5 thousand holdings reported as having compact plantation, which is 31.7% of the total holdings growing permanent crops, while the rest (927.4 thousand) reported growing scattered permanent trees. Comparing with 1991/92, the number of holdings with permanent crops has slightly increased by 3.3%.

While there was a slight increase in the number of holdings growing permanent crops between 1991/92 and 2001/02, the proportion of growers of permanent crops relative to the total holdings in the country decreased from 48.6% in 1991/92 to 40.7% in 2001/02. But there was an observed increase in the number of compact plantations from 281.4 thousand holdings in 1991/92 to 429.5 thousand holdings in 2001/02, see TABLE 7.1.

However, the increase by about 52% in the number of holdings growing permanent crops did not result in a big increase in the area of compact plantation. But there was an increase in area of 12.9% within a period of ten years, from 29.4 thousand hectares in 1991/92 to 33.2 thousand hectares in 2001/02.

It was observed that the average area of compact plantation per holding has been declining from 0.1960 hectare in 1981/2 to 0.1045 hectare in 1991/92 and further down to 0.0774 hectare in 2001/02, see TABLE 7.1.

FIGURE 7.2 COMPACT PERMANENT CROP PLANTATIONS, 2001/02 ('000 HA)

7.3 Ecological belt comparisons

In 2001/02, Hill belt reported the biggest number of growers of permanent crops. Of the total growers of permanent crops, 53.6% were found in Hill belt while 39.5% were in Tarai. Only 6.9% of permanent crop growers were found in Mountain belt.

Comparatively, there was an increase in the number of holdings growing permanent crops in Hill and Tarai belts between 1991/92 and 2001/02 but the increase in the Hill belt area was not as much as the increase in Tarai. The increase in Hill belt was less than 1% while that of Tarai was 17.0%. However, there was a noted decrease in the number of holdings growing permanent crops in the Mountain belt from 136.5 thousand to 94.2 thousand, a decrease of about 31% in ten year's time. In terms of compact plantation, the increase in the number of growers between 1991/92 and 2001/02 was remarkable in Hill belt from 78 thousand holdings to 191 thousand holdings, an increase of 145%. Tarai compact growers also increase but not as much from 190.3 thousand to 213.5 thousand, an increase of 12.2% for the same period.

Despite the decrease in the total number of permanent crop growers in Mountain belt, there was also a significant increase in the number of holdings growing compact plantation between 1991/92 and 2001/02 from 13.1 thousand to 25 thousand, an increase of about 91%. This increase also resulted to the more than double increase in the area of compact plantation from 700 hectares to 1600 hectares, an increase of 128.6%.

Tarai belt reported 65.6% of the total area of compact plantation (21.8 thousand hectares out of 33.2 thousand hectares). Mountain belt reported the least area of compact plantation of only 1.6 thousand hectares representing only 4.7% of the total while Hill belt reported the rest with 9.9 thousand hectares.

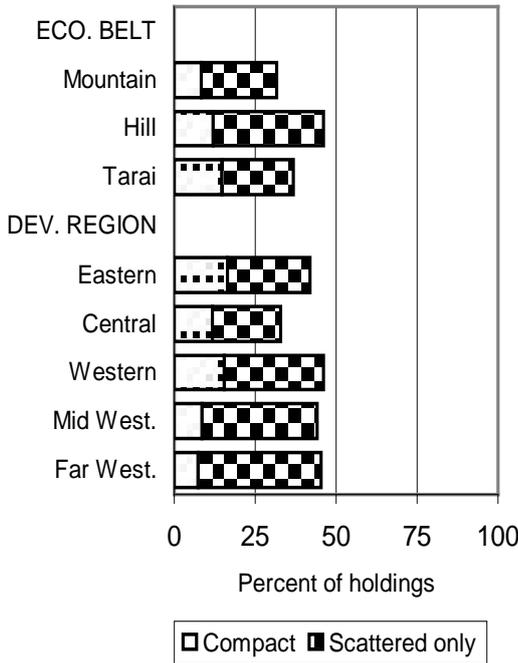

Although Hill belt has only 9.9 thousand hectares of compact plantation, the number of holdings growing permanent crops consisted of 44.5% (191 thousand) of the total holdings growing permanent crops in 2001/02. The big increase in the number of growers in Hill belt has depressed the average area of plantation per holding to only 516 square meters, the lowest among the three belts.

About 82% of holdings planting tea were found in the Hill belt, 14% in Tarai and the rest, 4% in Mountain belt.

7.4 Development regions comparisons

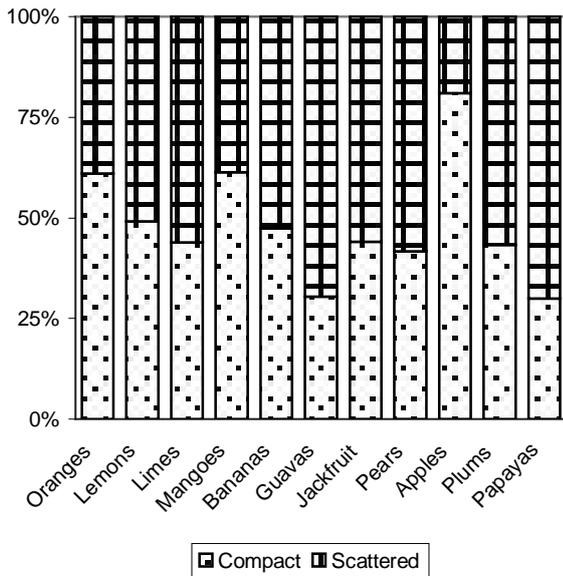

Except in Central development region, the proportion of holdings growing permanent trees relative to the total land holdings within the region in 2001/02 ranged from 42% in Eastern region to 45.4% in Far-Western region, to 44.2% in Mid-Western region, to 46% in Western region. The proportion of permanent crop growers in Central development region was 32.8%. While proportionally Central region yielded the lowest percentage of

FIGURE 7.3: HOLDINGS WITH PERMANENT CROPS, 2001/02

permanent crop growers within the region, it reported the largest number of holdings growing permanent crops among the five regions. Far-Western region reported the least number of holdings, see TABLE 7.2

FIGURE 7.4: COMPACT AND SCATTERED TREES, NEPAL, 2001/02

Compact plantation growers were mostly found in three regions, namely: Eastern region, 132.2 thousand holdings; Central region, 122.0 thousand holdings; and

Western region, 110.6 thousand holdings. Mid Western and Far Western regions reported only 40.1 thousand and 24.5 thousand holdings growing compact plantation, respectively.

Of the 33.2 thousand hectares of compact plantation, more than one-third or 11.9 thousand hectares were found in Central region while 10.3 thousand hectares were in Eastern region. The three other regions reported the following area of compact plantation: Western region, 6,700 hectares; Mid-Western region, 3,100 hectares and Far-Western region, 1,200 hectares.

Central region had the largest average area of compact plantation per holding in 2001/02 with 979 square meters compared with the national average of 774 square meters, see T.ABLE 7.2.

Tea plantations were mostly found in Eastern region with 57% of the holdings growing tea and in Western region, 35% of the holdings were growing tea.

7.5 Comparison of small and large holdings

Majority of the holdings growing permanent crops was found in the middle-sized holdings of 0.5 to less than 2 hectares while 10% of the holdings growing permanent crops belong to the large holdings. Holdings with less than half a hectare comprised 39.1% of the total.

The distribution of compact plantations is still dominated by the middle-sized holdings where 56.6% of the total compact plantations belong, while a little more than one-fourth (25.5%) were with the small holdings. Compact plantations among large holdings consisted of 17.9% of the total.

Among the large holdings growing permanent crops, 56.4% were engaged in

compact crop growing, while the small holdings reported only 20.7%.

The most popular fruit tree among the large holdings is mango where 69.5% of the holdings reported growing mango trees. On the other hand, bananas were reported as the most common permanent crop among the small holdings where about one-third or 33.6% of the holdings have banana trees. The second permanent tree in importance is mango with less than a third of the holdings reporting. Other fruit trees that were usually present in about 10% to 17% of the holdings were: oranges, lemon, guavas, jack fruit, plums and papayas. Very few holdings reported the growing of pineapples, lychees, apples, pears and pomegranates, see TABLE 7.5.

7.6 Productive/non-productive trees

Of the 33,200 hectares planted to compact permanent trees, 26,500 hectares were reported to be productive or bearing fruits. This represents almost 79.8% of the total area of compact plantation. Non-productive trees occupied an area of 6,700 hectares equivalent to 20.2% of the total area under compact plantation.

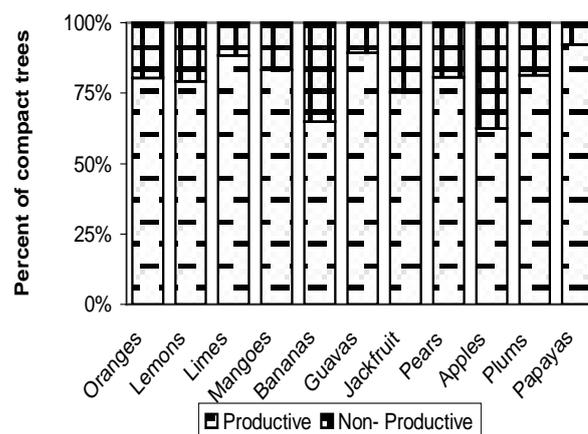

There were a total of 12,932,000 fruit trees found in compact plantation of 33,200 hectares involving 429,400 land holdings. The average density per hectare of compact plantation in 2001/02 was 390 trees per hectare. In 1991/92 the total number of trees in compact plantation was 9,110,700 in an area of 29,400 hectares operated by 281,400 land holdings. The density per hectares was 310 trees per hectare. There was an increase of 25.8% in the density of compact plantation.

Of the 12.9 million fruit trees in compact plantations, about 9.5 million trees or 73.5% were productive or bearing fruits. The highest percentage of fruit trees bearing in 2001/02 was papaya with 92.4% of the total trees bearing, followed by guavas with 89.4% productive. Other fruit

trees with more than 75% productive in 2001/02 were the following: lime, 89.4%; mangoes, 83.4%; plums, 81.35%; pears, 80.5%; oranges, 80.4%; lemons, 79.3%; and jack fruit, 75.4%, see TABLE 7.10.

Among the non-productive trees, lychees reported the highest percentage of 53.9% of the total fruit trees of not being

FIGURE 7.5: PRODUCTIVE AND NON-PRODUCTIVE TREES, COMPACT CROPS, NEPAL, 2001/02

productive. The second largest group of non-productive trees percentage-wise was pomegranate with 45.5%.

For teas, 81% of the total area planted was reported to be productive in 2001/02. In 1991/92, the percentage of area with productive tea was higher at 88.1%.

7.7 Thatch, fodder trees and bamboo

For agriculture census purposes, thatch, fodder trees and bamboo grown in compact plantation within the boundaries of the agricultural holding were considered as permanent crops. Since these are not food crops, these were treated separately from the fruit crops.

Of the 3.34 million land holdings in Nepal in 2001/02, about 266,300 holdings or 8.0% of the total were found to cultivate thatch, 585,300 holdings or 17.5% were growing fodder trees and 353,100 holdings

or 10.6% of the total holdings were growing bamboo.

There was an increase in the number of holdings that cultivated thatch by 22.4% between 1991/92 and 2001/02. There was a minimal increase of 2.2% in the number of holdings in raising fodder trees but in the case of the bamboo, there was a decrease of 12.8% in the number of holdings engaged in the cultivation of bamboo during the same period.

In 2001/02, the total area of compact plantation of thatch was 67,600 hectares, an increase of 1.9% over the compact area in 1991/92. For fodder trees, the compact area in 2001/02 was 7,300 hectares and this area is 191.2% more than the compact area in 1991/92, which was only 2,500, the biggest increase was observed to have occurred in the Hill belt.

The compact area for bamboo in 2001/02 was comparatively the lowest among these three crops, which was 6,300 hectares and

the increment was also minimal when compared with 1991/92 compact area of 6,000 hectares. In 1991/92, Hill belt reported the largest compact area of bamboo at 3200 hectares compared with 2400 hectares in Tarai and 500 hectares in Mountain. However, in 2001/02, Tarai belt reported the biggest compact area of 4000 hectares of bamboo plantation, an increase of 66% compared with decreased area in Mountain and Hill belts, see TABLE 7.11.

By development regions, a big increase in the number of holdings with compact plantation for thatch was noted in Central, Western and Far-Western regions between 1991/92 and 2001/02 but the number of growers decreased in Eastern and Mid-Western regions for the same period. The same trend was observed for fodder trees. However, for bamboo, it is only in Far-Western region where an increase was noted.

CHAPTER 8 IRRIGATION

Definition of irrigation adopted for the census refers to purposively providing land with water, other than rain for crop production. With increase in number of holdings having irrigation, area under irrigation has increased over the years. In 1981/82, 845.8 thousand holdings reported having irrigation covering a total area of 583.9 thousand hectares. This increased to 1997.6 thousand holdings with area coverage of 1168.3 thousand hectares in 2001/02. Almost 60 percent of land holding reported having some form of irrigation in 2001/02.

Land area under irrigation had increased from 23.7 percent in 1981/81 to 44.0 percent in 2001/02.

In 1981/82, 19.8 thousand hectares (3.3%) in mountain, 119.2 thousand hectares (20%) in hill and 444.9 thousand hectares (76%) in tarai were irrigated land. Likewise in 1991/92, 41.8 thousand hectares (5%) in mountain, 245.5 thousand hectares (28%) in hill and 595.1 thousand hectares (67%) in tarai were irrigated land.

In the same way in 2001/02, the irrigated land of mountain, hills and tarai were 62.1 thousand hectares (5%), 304.9 thousand hectares (26%) and 801.3 thousand hectares (69%) respectively.

The trend shows that irrigated land of tarai in 2001/02 increased by 34 percent compared to 1991/92 and increased by 80 percent compared to 1981/82.

Table 8.0 Summary Statistics

Description	Census year		
	1981/82	1991/92	2001/02
Number of Holdings with Irrigation ('000)	845.8	1,377.5	1,997.6
Percent of Land Holdings	38.7	50.9	59.9
Area of Irrigated ('000 ha)	583.9	882.4	1,168.3
- Mountain ('000 ha)	19.8	41.8	62.1
- Hill ('000 ha)	119.2	245.5	304.9
- Tarai ('000 ha)	444.9	595.1	801.3
Percent of Holding Area	23.7	34.0	44.0

8.1 Concept of Irrigation

For the purpose of the 2001/02 Agriculture census, irrigation refers to purposely providing land with water through artificial means for crop production or improving pastures. Natural flooding of land by rainfall or overflow of rivers is not considered as irrigation. However, when rainwater and uncontrolled overflow of water from rivers and streams are collected, stored and later on used on the land for crop and pasture production, this is considered as irrigation.

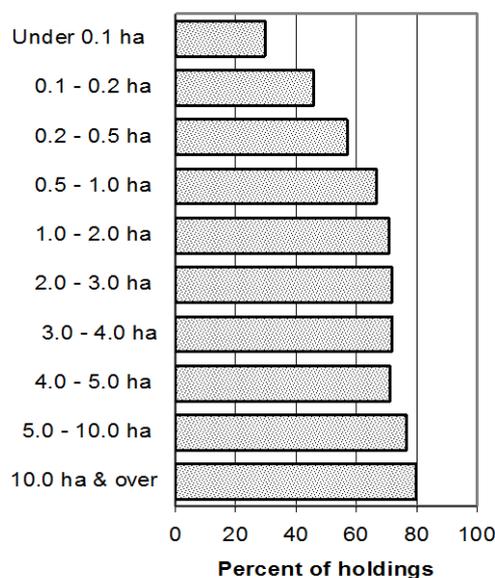

8.2 Land holdings with access to irrigation

The number of land holdings that have access to irrigation facilities in Nepal has been increasing through the years. In 1981/82 a total of 845,800 holdings reported of having irrigation in their farming operations. This number represented 38.7% of the total holdings in the country during that period. The number of holdings with irrigation had increased to 1.4 million in 1991/92, which was 50.9% of the total holdings existing at the time, an increase of 62.9%. In 2001/02, almost 2 million holdings availed of irrigation facilities, which is 59.9% of the total holdings, an increase of 45% over the number in 1991/92.

Tarai belt registered the highest proportion of holdings with irrigation relative to the total holdings within the belt in 2001/02 at 63.3% compared with Mountain belt of 58.2% and Hill belt with 57% of the total holdings with irrigation facilities. In 1991/92, the number of holdings with irrigation in Tarai was 545,300 holdings. This represented 49.9% of the total holdings in Tarai. In 2001/02, the number of holdings with irrigation shut up to 922,700 holdings, an increase of 377,400 holdings more with irrigation facilities which is about 69% over the number in

1991/92. The increase in the number of holdings with irrigation in Hill belt was also significant from 681,800 holdings to 902,100 holdings, an addition of 220,300 holdings that translated to an increase of 32.3%. It is in the Mountain belt where the increase is not dramatic, from 150,500 holdings with irrigation to 172,900 irrigated holdings, an increase of only about 15%.

FIGURE 8.1: HOLDINGS WITH IRRIGATION BY SIZE OF HOLDING, NEPAL, 2001/02

It is significant to observe that the size of the holding is positively correlated with the incidence of holdings with irrigation facilities. That is, as the size of the holdings becomes bigger, the proportion of land holdings with access to irrigation increases. The above chart illustrates the positive relationship. If we look at TABLE 8.8, the access to irrigation facilities has greatly improved among the small holdings, especially those below 0.1 hectare where the increase in the number of holdings with irrigation registered at 91.5% between 1991/92 and 2001/02. It is noted that as the size of the holding becomes bigger, the increment in the use

of irrigation declined up to the point where the number of holdings availing of irrigation facilities actually decreased in number. This phenomenon was observed to occur among the large holdings starting with size 3 hectares onwards, see TABLE 8.8.

8.3 Land under irrigation

The total land area under irrigation has steadily increased proportionally and physically since 1981/82.

In 1981/82, the total land area irrigated registered at 583,900 hectares. This was 23.7% of the total land area of the holdings. The area under irrigation increased to 882,400 hectares in 1991/92, an increase of 51.1% over the area in 1981/82. There was also a corresponding increase in the proportion of this irrigated area to the total land area of the holdings during the period, to 34%.

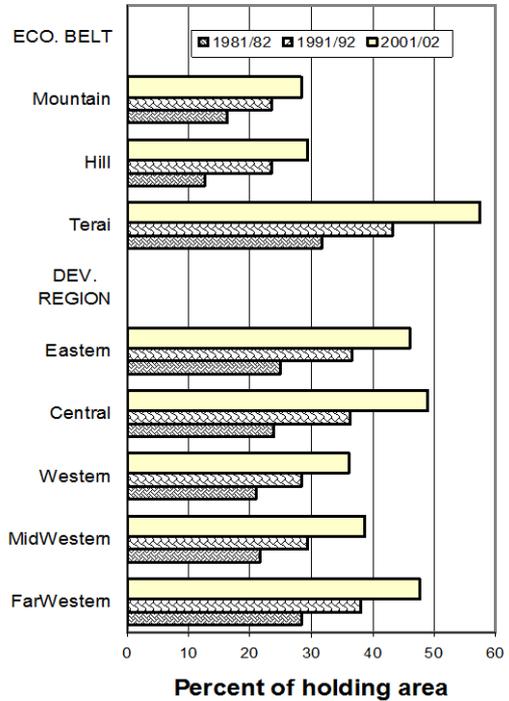

In 2001/02, the area under irrigation had increased to 1,168,300 hectares, an increase of 32.4% over the area under irrigation in 1991/92. Take note, however, that the increase has started to slow down when compared with the level of increase between 1881/82 and 1991/92.

By ecological belt, it is observed that there was a sizeable increase in the area irrigated between 1991/92 and 2001/02 in Tarai belt from 595,100 hectares to 801,300 hectares, an increase of about 35%; 41,800 hectares to 62,100 hectares in Mountain belt, an increase of about 49%; and 245,500 hectares to 304,900 hectares in Hill belt, an increase of approximately 24%.

The proportion of the irrigated area relative to the total area of the holdings was observed to be rather high in Tarai at 57.4% compared with only 29.4% and 28.4% in Hill belt and Mountain belt, respectively.

Like the ecological belts, all the development regions exhibited increases in

FIGURE 8.2: AREA OF LAND IRRIGATED, 1981/82, 1991/92 AND 2001/02

the area under irrigation since 1981/82 up to 2001/02. However, it was observed that the increases had slowed down except in Central development region where the increase between 1991/92 and 2001/02 was higher than the increase between 1981/82 and 1991/92, see TABLE 8.2.

The average area under irrigation has been going down from 0.6904 hectare in 1981/82 to 0.6406 hectare in 1991/92 and 0.5849 hectare in 2001/02. However, if we examine the averages by ecological belt, there seemed to be an increasing average in Mountain belt that runs counter to the trend in Hill and Tarai belts, both of which were on the downtrend.

Except for Mid-Western region where the average irrigated area was increasing, all the other regions exhibited a decreasing average size of irrigated area per holding.

8.4 Source of irrigation

About 57% of the total holdings with irrigation reported “canal (seasonal)” as the source of irrigation water to irrigate their holdings in 1991/92. The percentage of holdings availing of this source declined a little bit in 2001/02 to 54.7% but the area irrigated had increased comparatively. It may be noted, however, that there are holdings that availed of several sources of irrigation water both in 1991/92 and 2001/02.

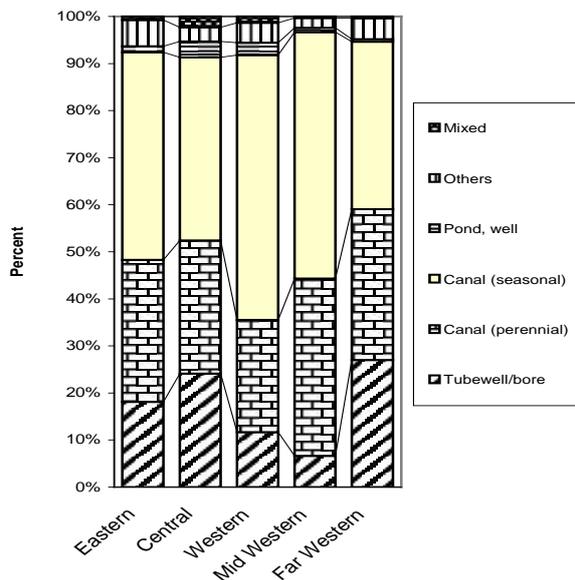

The second most common source of irrigation both in 1991/92 and 2001/02 is the canal (permanent) where 37.4% of the total holdings reported in 2001/02 as the

source of irrigation. Tubewell/bore was availed of only by about 8.7% of the holding in 1991/92 and 15.2% in 2001/02.

However, in Tarai, tubewell/bore ranked second as the source of irrigation compared with canal (permanent) for the Hill belt and Mountain belt.

In Hill and Mountain belts, almost all of the irrigated land holdings depend on canal (seasonal) as well as canal (permanent) as their source of irrigation water. In Tarai belt, there were three important sources of irrigation, as follows in the order of importance areawise: canal (seasonal), 309,700 hectares; tubewell/bore, 212,200 hectares; and canal (permanent), 207,600 hectares.

FIGURE 8.3: SOURCE OF IRRIGATION, NEPAL, 2001/02, PERCENT OF IRRIGATED LAND

By development regions, the two most common source of irrigation are: canal (seasonal) and canal (permanent) where almost 90% of all the holdings reported as their source.

In terms of the area being served by irrigation, there were three regions where three sources were utilized. These sources are canal (seasonal), canal (permanent) and tubewell/bore and the three regions were: Eastern, Central and Far-Western. The use of tubewell/bore for irrigation in Western and Mid-Western regions covered only 11.7% and 6.6% of the total irrigated area, respectively.

9.1 Agricultural inputs

Statistics on the agricultural inputs used in the farming operations of agricultural holdings in Nepal are necessary information required to support the developmental efforts of government as well as the private sector in improving the output from agriculture. Agricultural inputs for the purpose of the Census of Agriculture are materials or improved practices that are used or adopted in the cultivation of crops and raising of livestock to increase agricultural production. These include the use of chemical fertilizers, use of improved seeds like high yielding varieties (HYVs), and, the use of pesticides for important crops grown by most holdings in Nepal.

FIGURE 9.1: GROWERS USING CHEMICAL FERTILIZER, NEPAL

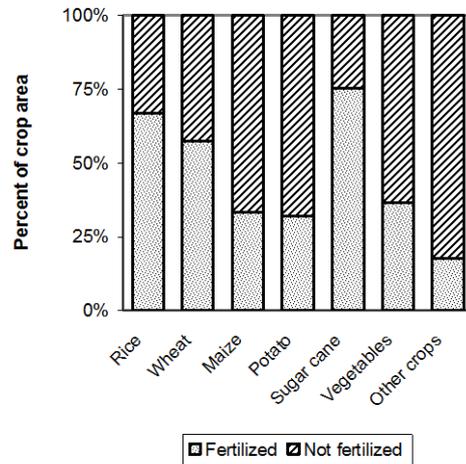

9.2 Growers using chemical fertilizers

There has been an increasing usage of chemical fertilizers in the cultivation of important crops in Nepal since 1981/82.

In 2001/02, sugar cane growers reported the highest percentage (66.7%) of using chemical fertilizers in their sugar cane fields although the number of growers was not as many as those engaged in the culture of rice, maize and wheat. Rice growers ranked second in the usage of chemical fertilizers with 64.9% of them using while wheat growers ranked third in the proportion of growers applying chemical fertilizers (57.7%). It ranked third also in the total number of growers engaged in crop cultivation. Take note that maize ranked second in terms of the total number of growers but only 35% applied fertilizers

FIGURE 9.2: CHEMICAL FERTILIZERS, AREA TREATED, NEPAL, 2001/02

in their maize field in 2001/02. Potato growers ranked 4th in the usage of chemical fertilizers with 38.8% of the total. This percentage was even higher than maize growing.

The levels of percentages in 2001/02 were considerably higher than in 1991/92 and in 1981/82. In the 80's the use of chemical fertilizer was not as yet popular. The highest proportion of fertilizer usage was reported among wheat growers with 26.9% while that of rice growers and sugar cane growers were 16% and 14.3%, respectively. In 1991/92, there was an upsurge in the use of chemical fertilizers on sugar cane with

71.2%. Wheat and rice growers also registered remarkable increases in usage to 52.4% for wheat and 48.8% for rice.

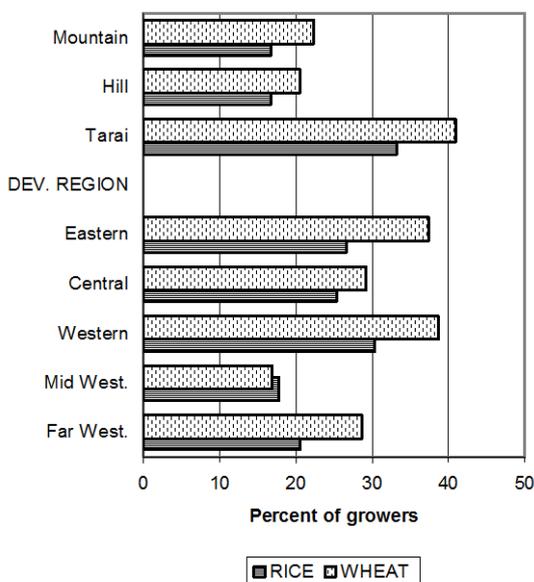

TABLE 9.2 shows the increases in the utilization of chemical fertilizers by type of crop between 1991/92 and 2001/02. It is observed that it is only in sugar cane where there was a decrease in the level of users. But despite the decrease in the number of sugar cane growers using chemical fertilizers, the area fertilized had increased. Notables in the increase in area fertilized were vegetables and maize with 150.5% and 81.6% increases, respectively.

9.3 Growers using improved seeds.

The use of improved seeds has not progressed very much between 1991/92 and 2001/02 although it can be seen from TABLE 9.1 that there was a big improvement in the use of improved seeds between 1981/82 and 1991/92.

In the 80's only 3.2% of the rice growers used improved rice seed varieties but the percentage went up to 24% in 1991/92. However, between 1991/92 and 2001/02, only 1.1 percentage points were added. In

FIGURE 9.3: GROWERS USING IMPROVED SEEDS, 2001/02

fact, for wheat, there was even a decrease by 0.7 percentage point in the proportion of wheat growers using improved wheat seeds as planting materials.

There was a significant increase on the use of improved seeds among potato growers from only 1% in 1981/82 to 17.9% in 1991/92 and further increased to 25.9% in 2001/02. Maize growers also increased in the adoption of improved seeds from 2.4% in 1981/82 to 11.9% in 1991/92 and increased to 14.9% in 2001/02.

In general, the use of improved seeds to increase production of the major temporary crops is comparatively low in Nepal.

9.4 Growers using pesticides

The use of pesticides by crop growers in the 80's was practically unknown where the highest percentage was reported among wheat growers with only 1% that applied pesticides in their farming operations. Less than 1% among rice, maize, potato and sugar cane growers used pesticides during the same period.

In 1991/92, the proportion of sugar cane growers increased to 23.5% which is quite remarkable and this percentage continued to increase in 2001/02 to 30.9%. In other words, almost one third of sugar cane growers used pesticides in 2001/02 to protect their cane fields from attacks of insects and pests.

Rice growers also increased their usage of pesticides from 0.8% in 1981/82 to 13.2% in 1991/92 and then 20.4% in 2001/02. This means that one out of 5 growers used pesticides in his rice fields.

Potato growers also increased their utilization of pesticides from 0.5% in 1981/82, to 10.7% in 1991/92 to 19.5% in 2001/02.

9.5 Rice

Among cereal crops, rice is still the most important temporary crop being raised by almost two-thirds of the total holdings in the country.

Of the 3.3 million holdings in 2001/02, 2.48 million holdings cultivate rice in an area of .54 million hectares. The rice growers were distributed unevenly in Tarai belt (1.26 million), Hill belt (1.02 million) and Mountain belt (203,300). While more than 1 million holdings planting rice were found in the Hill belt, only 353,000 hectares of rice land were being tilled by them. Of the 1.54 million hectares of rice land, 1.12 million rice land were located in the Tarai belt. This makes Tarai belt rice farmers important in the production of rice.

Among the development regions, the Eastern, Central and Western regions have an aggregate of 1.9 million rice farmers with 1.24 million hectares of rice land comprising 80% of the total rice land in Nepal. These three regions therefore are important to rice growing.

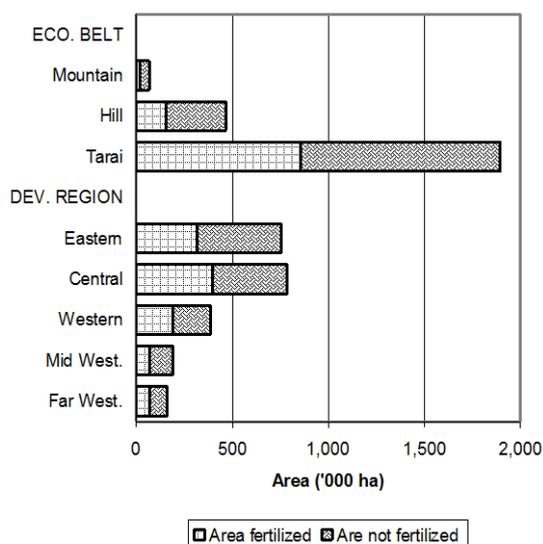

Among the three ecological belts, Tarai belt rice holdings seem to exhibit the highest percentages of usage of improved seeds,

pesticides and chemical fertilizers both in 1991/92 and 2001/02. However, in the use of improved seeds, there was a decrease in the percentage of users between 1991/92 and 2001/02 from 36.9% to 33.2%. What was notable was the big increase in the number of rice growers using chemical fertilizers in Tarai from 66.2% in 1991/92 to 82.3% in 2001/02 and the area applied to fertilizer from 52.8% to 76.6% of the total crop area. There was also an increase in the use of pesticides but the level of usage was comparatively low from 20.9% in 1991/92 to 28.5% in 2001/02.

Among the development regions, the proportion of users of chemical fertilizers among rice growers in Central region was reportedly the highest at 89.1% in 2001/02 from 87.8% in 1991/92. Second in rank in usage was far below at 64.5% in Western region and the third ranking was Eastern region with 61.3%.

There had been an improvement in the use of improved seeds in four regions except Central region. In 1991/92, Central region reported the highest proportion of improved seeds users at 34.5% but declined to 25.3% in 2001/02. On the other hand, Western region reported the highest percentage of users of improved seeds in 2001/02 at 30.3%.

FIGURE 9.4: CHEMICAL FERTILIZERS, RICE AREA TREATED, 2001/02

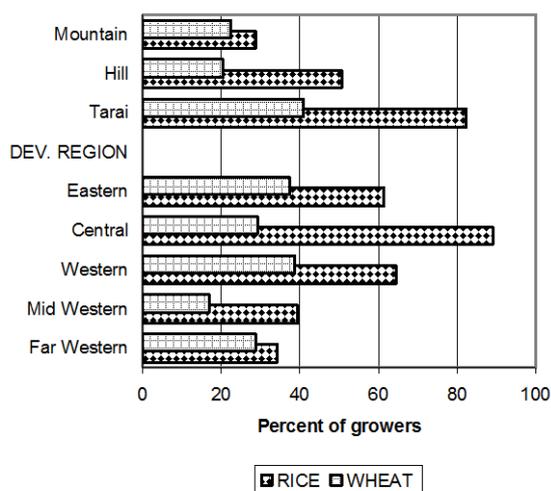

9.6 Wheat

Growing of wheat in Nepal has progressed slowly in terms of the utilization of inputs that increase production. At the national level, majority (52.4%) of wheat growers used chemical fertilizers in 1991/92. This percentage increased to 57.7% in 2001/02. On the use of pesticides, only 5.4% of the growers used it in 1991/92 and this proportion increased to 8.9% in 2001/02. However, in the use of improved seeds, the proportion of growers decreased from 30.7% in 1991/92 to 30.0% in 2001/02.

By ecological belt, the picture changes. Wheat growers in Tarai and hill belts using chemical fertilizers suddenly reduced in

FIGURE 9.5: GROWERS USING CHEMICAL FERTILIZER, 2001/02

proportion. Tarai belt growers decreased from 78.7% in 1991/92 to only 40.9% in 2001/02 while Hill belt growers decreased from 36.7% to only 20.5% for the same period. While the number of growers decreased proportionally, the area treated with fertilizers increased during the same period. In Tarai belt, the area fertilized in 1991/92 was 69.5% of the total crop area. In 2001/02, the area fertilized increased to 78.2% of the total crop area. The same trend was observed for Hill belt but the increase was not significant, see TABLE 9.4.

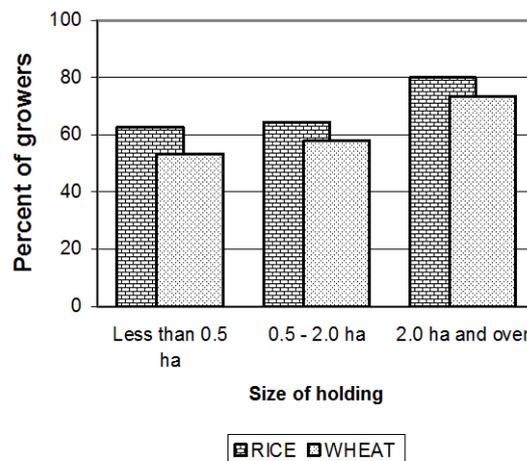

The same pattern in Tarai belt and Hill belt was observed in the utilization of improved seeds where the proportion of wheat growers using improved seeds declined between 1991/92 and 2001/02.

While the use of pesticide was not as prevalent as the chemical fertilizer, the proportions of users have increased conservatively within the ten-year period being observed.

By development regions, four out of five regions reported a decrease in the usage of chemical fertilizers. It was only in Mid-

Western region where an increase in the use of fertilizers was observed. However, it might be delightful to know that the areas

FIGURE 9.6: GROWERS USING CHEMICAL FERTILIZER BY SIZE OF HOLDING, NEPAL, 2001/02

treated with fertilizers increased in four regions out of five, with the exception of Central region where the area decreased from 79.8% of the total crop area in 1991/92 to 78.2% in 2001/02.

9.7 Maize

Maize is second in rank to rice as temporary crop raised by holdings in Nepal. There were 2.2 million holdings reporting in 2001/02 as cultivating maize in an aggregate area of 769,400 hectares. Most of these holdings (1.46 million) were found in Hill belt with aggregate crop area of 510,200 hectares. Tarai belt maize growers totaled 448,300 with a total crop area of 175,200 hectares while in Mountain belt there were 256,200 maize growers involving 84,000 hectares. The bulk of maize growers in development regions was spread out in Eastern, Central and Western regions in an aggregate area of 608,400 hectares, which is 79.2% of the total area sown to maize.

The application of chemical fertilizers in maize fields was not as prevalent as in the culture of rice. In 1991/92, 22.6% of maize

growers used chemical fertilizers and in 2001/02 the users increased to 35%. The total area fertilized also increased from 18.3% of the total crop area in 1991/92 to 33.2% in 2001/02. It is interesting to observe that the Mountain belt reported the highest proportion of maize growers with 25.1% of the total growers in this area followed by Hill belt with 23.8%. Tarai belt reported the lowest percentage of chemical fertilizer users on maize at 16.9% of the total holdings with maize.

Among development regions, Central region reported an extraordinarily high percentage of fertilizer users on their maize farm compared with the other regions both in 1991/92 and 2001/02. In 1991/92, 61.4% of the maize holdings used fertilizer in Central region compared with only 12.6% for Western region and 11% for Eastern region. In 2001/02, the fertilizer users in Central region increased to 68.6% compared with 29.5% for Western region and 30.2% for Eastern region, see TABLE 9.5

While Tarai belt reported the lowest proportion of fertilizer users among maize growers, it reported the highest proportion of usage of improved seeds with 17.8% compared with only 11.1% for Hill and 6.3% for Mountain belt..

The same trend was observed for users of pesticides where Tarai belt reported the highest percentage at 5.1% followed by Hill belt with 2.5% and 0.6% in Mountain belt in 1991/92. In 2001/02, the percentage of users in Tarai belt increased to 8.8% followed by Mountain belt with 3.5% pesticide users and Hill belt with 2.9%.

Central development region reported the highest percentage of pesticide users among the five development regions at 6.9% followed by Eastern region at 5.4% in 2001/02.

9.8 Other crops

The use of agricultural inputs in the cultivation of other crops in Nepal is not as popular as in the three major temporary crops earlier discussed.

In 1991/92, the percentage of users of chemical fertilizers among potato growers registered at 30.5% and this percentage increased to 38.8% in 2001/02. Tarai belt reported the highest proportion of fertilizer users both in 1991/92n and 2001/02 at 41.5% and 54.4%, respectively compared with only 26% and 31.7% for the same period among potato growers in Hill belt.

Among development regions, Central region reported the highest percentage of users at 60.2% in 1991/92 and increased to 61.6% in 2001/02. It seems that it is this region where improved farm practices are observed by majority of the holdings compared with other regions.

The users of fertilizers among vegetable farmers are comparatively lower than potato growers both in 1991/92 and 2001/02. Tarai belt vegetable growers still reported the highest percentage of users compared with the other belts.

On the use of improved seeds and pesticides, still tarai belt growers reported the highest usage. Users of improved seeds and pesticides among sugar cane growers in Hill and Mountain belts are negligible when compared with those in Tarai belt.

9.9 Comparison of small and large holdings

The use of agricultural inputs in the different holdings according to size category seemed to reveal a pattern for the three major temporary crops. TABLE 9.9 shows that the large holdings reported a higher incidence of usage of the three agricultural inputs than the smaller ones.

On the use of improved seeds, the large holdings reported a usage percentage of 38.8% for rice compared with 21.1% for small holdings; 73.5% for wheat compared with 26.3% for small holdings; and 22.1% for maize compared with 13.1% for maize.

The same pattern was observed on the use of pesticides although the difference was rather big when compared with rice. For large holdings, the use of pesticides registered at 87.9% of the total large holdings compared with only 17.4% for the small holdings.

For wheat growing, the difference was not as great compared with rice but still there is a wide gap, 13.5% for the large holdings against 7.9% among the small holdings. For maize, users of pesticides among large holdings was only 8.4% of the total compared with 3.7% of the total among small holdings.

In the application of chemical fertilizers, the large holdings also reported higher percentages for the three crops but the difference was not as great compared with the first two inputs discussed.

In 2001/02, almost 80% among large holdings reported as having used chemical fertilizers for rice cultivation compared with 62.5% users among small holdings. For wheat, about 74% of the large holdings used fertilizer compared with 53% users among the small holdings.

For maize growing, the difference in the percentage of users of chemical fertilizers among the different sizes of holdings was not very apparent although the large holdings reported a little bit higher percentage (37.1% vs. 34.5%).

CHAPTER 10

AGRICULTURAL EQUIPMENT

Mechanization of agriculture in Nepal is at very low level. There were about 315.1 thousand holdings using the most common agricultural equipment, iron plough in 1991/92. This number increased to 870.3 thousand holdings in 2001/02.

The use of tractors has been increasing slowly. From 1.2 percent of the total holdings using tractors in 1991/92 it increased to 8.2 percent in 2001/02. Thresher occupies a very important place among equipment used in farming operation. The use of thresher in farming

operation has also been increasing. From 3.2 percent of the total holdings using it in 1991/92 it increased to 7.5 percent in 2001/02. Pumping set, which is also very important agricultural equipment for the purpose of irrigation, has increased from 3 percent holdings using it in 1991/92 to 6.3 percent holdings in 2001/02. Though farm mechanization in Nepal is still at incipient stage, there are indications of improvement. Use of equipment such as power tillers, sprayers, rower pumps is on the rise. However, the number of animal drawn carts has stagnated over the decade.

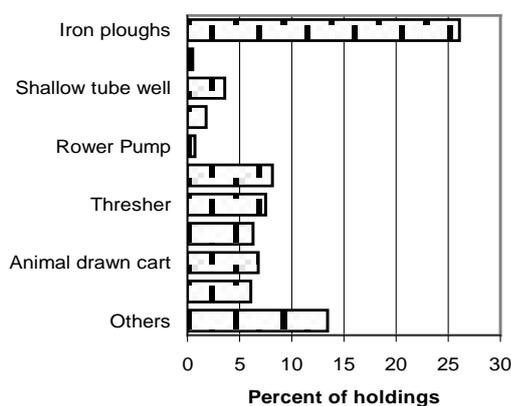

Table 10.0 Summary Statistics

Types of equipment	1991/92		2001/02	
	Holdings using equipment ('000)	Number of Items ('000)	Holdings using equipment ('000)	Number of Items ('000)
Iron ploughs	315.1	354.5	870.3	890.2
Power tillers	5.6	1.6	15.6	11.8
Shallow tube well	50.9	48.2	119.7	109.5

Pumping set	81.3	41.3	210.4	146.1
Animal drawn cart	204.6	198.1	226.4	199.1
Sprayer	50.2	23.4	203.0	145.9
Others	296.5	878.4	449.0	1,072.7

10.1 Agricultural equipment

For the purpose of the Agriculture Census, agricultural equipment refers to machinery and equipment used on the holding, wholly or partly for agricultural production. Machinery and equipment in usable condition whether owned or not owned but used on the holding were included. Excluded were machinery and equipment used exclusively for non-agricultural purposes.

FIGURE 10.1: USE OF AGRICULTURAL EQUIPMENT, NEPAL, 2001/02

10.2 Type of equipment

Capital formation in agriculture in Nepal is rather limited, although there has been some improvement in the number and kind of equipment available and used on the land holding between 1991/92 and 2001/02. The number of equipment by type is shown in TABLE 10.5.

The iron plough was the most popular equipment available on the holding both in 1991/92 and 2001/02. In 1991/92 only 315,100 or 11.7% of the total holdings used iron ploughs in their farming operations. The number of holdings using this equipment more than double in 2001/02 with 870,300 holdings reporting. This number represented 26.1% of the total holdings in the country. While the number

of users increased within the ten-year period, the ownership of the equipment has declined from 98.8% in 1991/92 to 90.4% in 2001/02.

There was also an increase in the use of tractors, from only 35,200 holdings that used tractor in 1991/92 (1.3% of the total holdings) to 272,900 holdings in 2001/02 that was 8.2% of the total. There was also a decrease in the proportion of holdings that owned the tractor, from 85.5% in 1991/92 to only 18.5% in 2001/02. The decrease in the proportion of owners of tractors is not surprising considering the cost of acquisition. While there was a decrease proportionally, there was actually an increase in the number available from 4,700 tractors owned in 1991/92 to 27,900 tractors owned in 2001/02. Investment in the purchase of tractor has greatly increased the capital formation in agriculture.

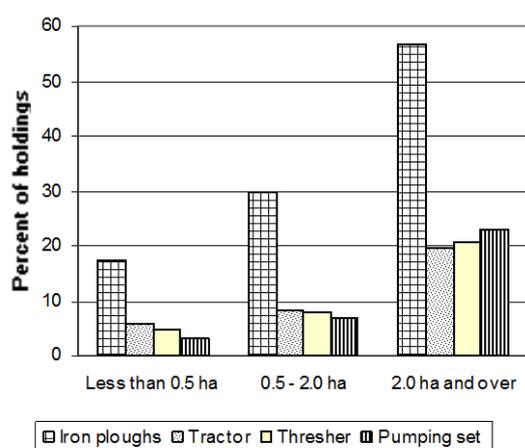

Another type of equipment which is important in farming operations that was observed to have significant increase is thresher, from 85,600 holdings reporting as having used it in 1991/92 to 249,500 holdings in 2001/02. This number is 7.5% of the total holdings in the country. Like the tractor, ownership also has gone down from 96.5% in 1991/92 to only 44.2% in 2001/02 but the actual number of threshers owned had increased from 19,200 to 57,100.

Another important piece of equipment that increased in usage proportionally is the pumping set equipment, from 3% of the holdings using this equipment in 1991/92 to 6.3% of holdings in 2001/02. Ownership of the equipment proportionally decreased but the number available actually increased from 40,000 sets in 1991/92 to 93,400 sets in 2001/02.

While the proportion of ownership of agricultural equipment may have decreased, in general, the accessibility and availability of these machinery and equipment to more holdings have been noted. Farm

mechanization of holdings in Nepal is still in its infant stage but there are indications of improvement during the ten-year period observed.

FIGURE 10.2: USE OF AGRICULTURAL EQUIPMENT BY SIZE OF HOLDING, NEPAL, 2001/02

10.3 Geographical distribution of equipment

TABLE 10.3 shows the distribution of equipment by ecological belts and TABLE 10.4 shows the distribution by development regions.

Of the 870.3 holdings that reported the use of iron ploughs in 2001/02, 810.3 holdings or 93.1% were found in Tarai belt. Among, holdings within Tarai belt, 55.5% reported of having used iron ploughs compared with only 1.8% within Mountain belt and 3.5% within Hill belt.

Furthermore, the use of tractors, threshers and pumping set equipment, Tarai belt holdings had higher incidence of usage compared to the holdings in Hill and Mountain belts.

Among development regions, Eastern region reported the highest proportion of holdings using iron ploughs with 40.3% compared with 27.9% in Far-Western region, 23.4% in Central region, 19.0% in Western region and 17.3% in Mid-Western region. The use of tractor and thresher, however, was observed to be highest in Central region although all regions have reported the use of the equipment.

Proportionally, Far-Western region holdings reported the highest usage of pumping set at 8.3% compared with 7.8% among those in Central region and 6.3% in Eastern region.

10.4 Comparisons of small and large holdings

Proportionally, the large holdings have higher percentage of usage of the different machinery and equipment used in their agricultural operation, see TABLE 10.7

It is significant to note that whatever pieces of equipment used in the large holdings in 2001/02 were also used in the small holdings, except that the available supply was limited in scale. For instance, tractors were also used in small holdings but only 6% of the total small holdings had access to tractors compared with 19.7% of holdings among the large holdings. The use of thresher was reported by 4.9% among small holdings while the large holdings reported 20.8% as having used thresher. This situation holds true for all the listed equipment found in TABLE 10.7, including animal-drawn cart.

TABLE 10.1: USE OF AGRICULTURAL EQUIPMENT OF LAND HOLDINGS BY TYPE, NEPAL, 1991/92 AND 2001/02

Type of equipment	1991/92			2001/02

NOTE: Use of equipment refers to use during the census year. Number of items is the number of equipment on the holding at the time of the census.

CHAPTER 11 LIVESTOCK AND POULTRY

The number of livestock and poultry in the country has been increasing with the exception of cattle and sheep. The estimated number of livestock and poultry in the 2001/02 census of agriculture were: cattle 7215.2 thousand, chauri 95.4 thousand, buffaloes 3477.7 thousand, goats 6932.9 thousand, sheep 471.2 thousand, pigs 632.6 thousand, chicken 17631.3 thousand and ducks 393.1 thousand.

There was a decline of about 2 percent in the cattle population between 1991/92 and 2001/02. The buffalo population increased by 11.6 percent during the same period. Likewise, goat and pig population also

increased by 25.7 percent and 27.6 percent respectively during that period. Sheep population had declined by 11 percent. Chicken and duck number have also increased by 43 percent and 40.2 percent respectively over the period of 1991/92 and 2001/02. The average number of cattle, chauri, buffaloes, goats, sheep, pig, chicken and ducks per holdings were 3.4, 6.7, 4.1, 4.0, 1.9, 11 and 3.5 respectively in 2001/02 agricultural census.

About 50.4 percent of the total female cattle in Nepal were in milk and 59.8 percent of the total female buffaloes were reported to be in milk in 2001/02 census.

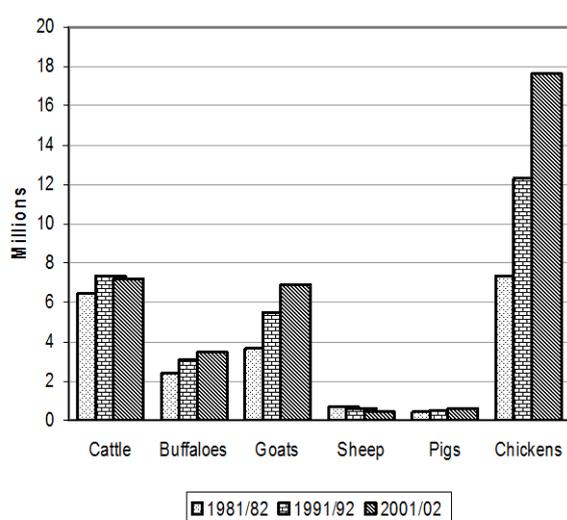

Table 11.0 Summary Statistics

Livestock Type	Holdings ('000)			Livestock ('000)		
	1981/82	1991/92	2001/02	1981/82	1991/92	2001/02
Cattle	1,261.9	2,067.1	2,297.4	6,501.6	7,359.3	7,215.2

Ducks	37.2	92.6	110.1	142.3	280.3	393.1

11.1 Livestock population

Livestock population in its generic sense includes all animals and birds found on the holding on the day of enumeration. The agriculture census operation was undertaken from January to June 2002. The reference date of the livestock and poultry population, therefore, refers to any day during this period when the enumeration took place.

FIGURE 11.1: LIVESTOCK NUMBERS, NEPAL, 1981/82, 1991/92 AND 2001/02

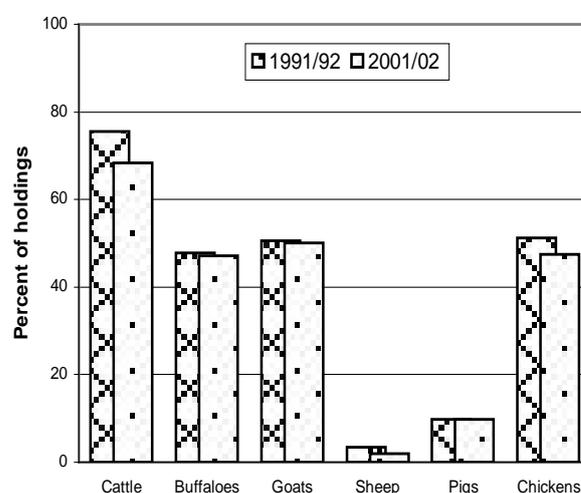

The large livestock included in the census of agriculture were cattle, chaunri, buffaloes, horses, and mules/asses while the small livestock included goats, sheep, pigs, rabbits and other animals. Rabbits were not reported as a separate animal in the 1991/92 census of agriculture but because of its growing importance, a separate count was done in the latest census.

For poultry, three types were reported separately. These are chicken, ducks and pigeons.

11.2 Holdings with livestock and poultry

About 68% of all holdings in 2001/02 reported the presence of cattle in their holding with a total count of 7.215 million heads, an average number of 3.14 cattle per holding. There was, however, a decrease of 2% in the cattle population between 1991/92 and 2001/02 and a corresponding decrease in the average number of cattle per holding.

FIGURE 11.2: HOLDINGS WITH LIVESTOCK, NEPAL, 1991/92 AND 2001/02

The average cattle per holding in 1991/92 was 3.54 heads, a decrease of 11.3% over 2001/02 average.

Among small livestock, goat was the most common animal raised in 1.69 million holdings with a total head count of 6.9 million in 2001/02. This number of goats raised in 2001/02 was 25.7% more than the 1991/92 count. In fact the big increase in the number of goats occurred during 1981/82 and 1991/92, which was double at 51.4%. This increase, however, may have affected the raising of sheep considering that the sheep population had been decreasing during the last 20 years, from 677,100 in 1981/82 to 602,800 in 1991/92 (11% decrease) and further down to

471,200 in 2001/02, a decrease of 21.6% between 1991/92 and 2001/02.

For poultry, there were 1.59 million holdings found to be raising chicken with a total chicken population of 17.6 million in 2001/02. There was an increase in the head count by 43% over 1991/92 figure. The average number of heads of chicken per reporting holding in 2001/02 was 11 compared with 8.8 heads ten years ago.

11.3 Cattle

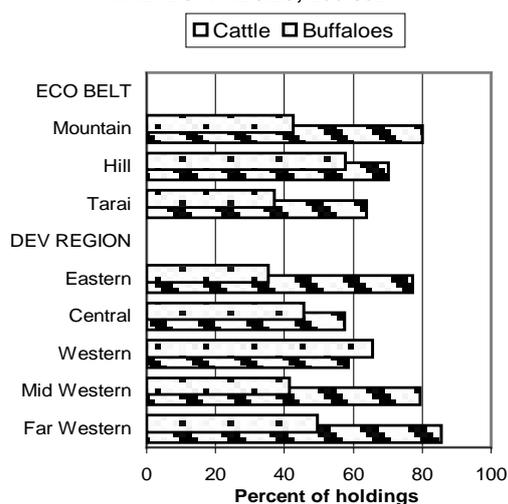

Cattle raising is most popular among holdings in the Mountain belt area with 80% of the holdings reporting an aggregate number of 963,300 heads in 2001/02, an average of 4 heads per holding. This average is almost one head higher than the national average of 3.14. Hill belt holdings reported the greatest number of cattle of more than 3.5 million heads but the average per holding registered much lower at 3.17, this figure hovers around the national average. Tarai belt reported the lowest proportion of holdings raising cattle was 63.9% of the total holding. The reported

heads, the lowest average among the holdings in the three belts.

Among development regions, Far Western region reported the highest incidence of cattle raising at 85.4% of the total although Eastern region reported the largest number of heads of cattle of almost 2 million but Mid-Western region reported the highest average per holding at 4.06 heads of cattle.

By size of holdings, it is logical that the large holdings reported the highest incidence of cattle raising at 87.2% with an average number per holding of 3.94 heads. Second highest proportion of holdings with cattle were the medium-sized holdings, 0.5 to less than 2 hectares, with 79.7% of them reporting cattle in their holding with an average number of 3.34 heads per holding. The next group of holdings that reported the third highest proportion of cattle raisers were those with no land at 65.1% with an average of 2.94 heads of cattle per holding. The lowest proportion of cattle raisers was found among the small holdings with 54.4% and reported also the lowest average per holding of only 2.66 heads, see TABLE 11.7.

FIGURE 11.3: HOLDINGS WITH CATTLE AND BUFFALOES, 2001/02

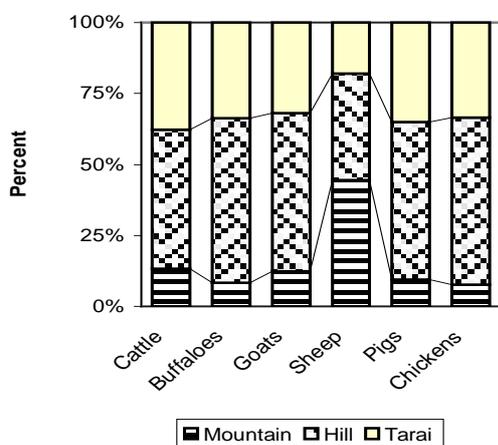

cattle population was 2.7 million heads and the average cattle per holding was 2.88

The male cattle population had increased between 1991/92 and 2001/02 from 4.13 million to 4.33 million. However, for female cattle population, the number has been decreasing especially the adult ones (3 years old and over), from 2.7 million in 1981/82 to 2.3 million in 1991/92 then went down to 1.8 million in 2001/02. On the other hand, the increasing male cattle population may be expected because these were used as work animals but the declining female cattle population cannot be explained considering that, in general, these are not slaughtered for meat purposes but they are good source of milk.

It is noted that among the younger cattle, there was an increase in the population

FIGURE 11.4: LIVESTOCK POPULATION BY TYPE, ECOLOGICAL BELTS, 2001/02

between the two censuses. For those under one year, the increase was 15.6% and for female cattle one to three years old, the increase was only about 8%.

11.4 Chaunri

There was a spurt growth in the number of chaunri raised between 1991/92 and 2001/02 from 55,600 to 95,400 or 62.9% increase compared with only 5.6% increase between 1981/82 and 1991/92. The increase in the number of holdings raising chaunri was also remarkable from 6,900 to 9,000 holdings between 1981/82 and 1991/92 to 14,200 holdings in 2001/02 or an increase of 30.4% and 57.8%, respectively.

Despite the big increase in the number of holdings tending to chaunri, it was noted that there were no holdings raising this type of animal in Tarai in 2001/02. Apparently this livestock grows only in temperate areas with 8,300 out of the 14,200 raisers found in the Hill belt and 5,900 holdings in Mountain belt. While most chaunri raisers were found in Hill belt area most of the chaunri population were found in Mountain belt (60.5%) or an average of 9.8 heads per

holding compared with an average of 4.5 heads per holding in Hill belt.

It may be significant to notice that all development regions reported some holdings raising chaunri with Eastern region reporting the most number of 4,500 or 31.7% of the total chaunri raisers. Far-Western region reported the least number of raisers of only 500 holdings.

As a whole, there were only 0.4% of the total holdings raising chaunri in Nepal in 2001/02 distributed in the different holding sizes including holdings without land, see TABLE 11.6.

11.5 Buffaloes

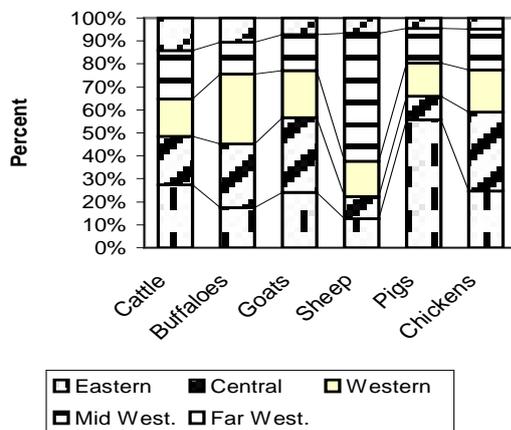

Holdings that raise buffaloes numbered 1.59 million in 2001/02, which is 47.2% of the total holdings in Nepal. Buffalo is second in rank in importance among large livestock with a population of 3.5 million in 2001/02, an increase of 11.6% over the count in 1991/92, which was 3.1 million heads. The big increase in the number of buffaloes occurred between 1981/82 and 1991/92 where the increment registered at 31%, see TABLE 11.1.

Proportionally, Hill belt holdings reported the highest with 57.6% of the total holdings raising buffaloes compared with only 47.2% in Tarai and 42.5% in Mountain belt.

Of the 3.5 million heads of buffaloes in 2001/02, 2 million heads or 58.0% were found in Hill belt area while 33.6% and 8.3% were in Tarai and Mountain belts, respectively. It may be mentioned that the average number of heads of buffaloes in the three belts are not significantly different, a little above 2 heads per holding although the Mountain belt had the highest average of 2.28 heads per holding compared with Tarai's average of 2.14 heads per holding, being the lowest average reported.

The buffalo population was also all over the different development regions although there may be differences in the proportion raising this livestock. Western region reported the highest proportion of holdings with buffaloes at 65.5% of the total holdings in this region followed by Far-Western region with 49.5%. Eastern region reported the lowest proportion of holdings with buffaloes although population-wise, it reported more than Far-Western region.

FIGURE 11.5: LIVESTOCK POPULATION, DEVELOPMENT REGIONS, 2001/02

The large holdings reported the highest proportion with buffaloes at 61.4% followed by holdings with sizes of from 0.5 hectare to less than 2 hectares with 55.1%. It may be interesting to see that almost a third of the holdings without land reported having buffaloes while 37.6% among small holdings reported that they have buffaloes in 2001/02.

Since 1981/92 up to 2001/02, the female population of buffaloes aged three years old and over registered a proportion of more than 85% of the total. This seems to indicate that holdings in Nepal do not dispose of their female buffaloes.

11.6 Large livestock in milk

TABLE 11.10 shows the proportion of milking animals relative to the total adult

female large livestock in Nepal. Among the three large livestock, buffaloes yielded the highest proportion that are milking, where almost 60% of the female buffaloes 3 years old and over were with milk in 2001/02. Chaunri milking animals consisted of 58.7% while cattle reported the proportion of milking cows at 50.4%.

11.7 Small livestock

The three most commonly raised small livestock in Nepal in 2001/02 in the order of their frequency were: goats, pigs and sheep.

Goat population reached almost 7 million in 2001/02 with 3.9 million heads in Hill belt and 2.2 million heads in Tarai while only 209,800 were found in Mountain belt. However, the highest average number of goat per holding was reported by Mountain belt (5.6 heads) and Tarai reported the least, which was 3.3 heads of goats per holding.

More than 50% of the holdings in Central region, Eastern region and Western region reported of raising goats in 2001/02.

There were more female goats than male in 2001/02. The adult female goats (six months and over) comprised 70.8% of the total goat population. The high proportion of adult female goats is a good sign that breeding of goats both for meat and for reproduction purposes was assured. The adult male goats consisted of only 29.2%.

While the goat population has been on the rise during the past 20 years, the opposite was observed on the sheep population. The number of holdings raising sheep had been on the decline since 1981/82 and this had affected the stock of sheep, which had been decreasing fast. Proportionally, the Mountain belt reported the highest proportion of sheep raisers with 4.8% of the total holdings. It also reported the most number of sheep. Of the 471,200 sheep

population, 209,800 or 44.5% were in the Mountain belt area while the Hill belt reported 176,200 heads or 37.4%.

Proportionally, Mid-Western region reported the highest percentage of holdings with sheep at 6.8% of the total holdings compared with the next highest, which was only 1.9% reported by Far-Western region, see TABLE 11.4.

Like the adult goat population, the female sheep population 6 months old and over was much higher than the male adult sheep population in 2001/02. The females consisted of 67.3% of the total adult sheep population, which is also a good indication that the propagation of the sheep is assured see TABLE 11.9.

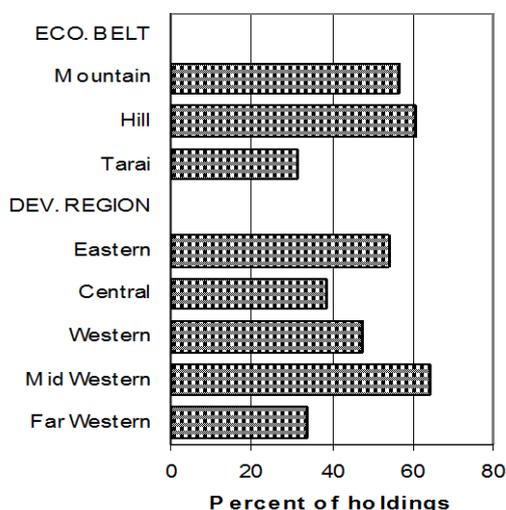

The pig population was observed to be on the rise also like the goat. This livestock is becoming popular as a source of meat supply in Nepal, second to chicken. Of the 327,800 holdings that reported raising pigs, 186,400 or 56.9% of the total holdings were in Eastern region. This number represents 23% of the total holdings in Eastern region. The second in rank proportionally is Mid-Western region where 8.8% of the total holdings raised pigs.

By size of holding, 317,200 heads out of 632,600 heads of pigs or 50.1% were raised in holdings with 0.5 hectare to less than 2 hectares in area. The small holdings reported a total of 238,400 heads that was 37.9% of the total pig population while the large holdings reported 10.4% of the total. Holdings without land reported the rest, which was 11,200 heads or 1.8% of the total.

11.8 Poultry

Chickens, ducks and pigeons compose the three most important poultry in Nepal. In 1981/82, the total number of holdings that raised chicken numbered 716,900 with a population of 7.4 million or an average heads of 10.3 chicken per holding. In 1991/92, the number of holdings raising chicken almost doubled (1.4 million) but the chicken population did not increase as much. The average number of heads of chicken per holding reduced to 8.8. In 2001/02, the number of holdings engaged in raising chicken increased slightly by 13.9% and the increase in the number of chicken was almost 43% of the total. The average heads of chicken per holding was 11.1, which was even higher than in 1981/82.

FIGURE 11.6: HOLDINGS WITH CHICKENS, 2001/02

Among the three belts, the Hill belt reported the highest percentage of holdings raising chicken at 60.6% compared with 56.3% and 31.5% in the Mountain and Tarai belts, respectively. Correspondingly, out of 1,594,400 holdings raising chicken, 960,800 holdings were located in Hill belt area, which is approximately 60% also.

Of the five regions, Mid-Western region reported the highest proportion of holdings with chicken at 64.3% followed by Eastern region with 54.3%. However, if we look at TABLE 11.4, Eastern region reported the

most number of holdings raising chicken followed by Central region.

There were more holdings that raised pigeons (202,100) than ducks (110,100) in 2001/02. Tarai reported the highest count

of both ducks and pigeons. Of the 393100 ducks, 264,700 heads or 67.3% of the total ducks were raised in Tarai and 1,035,800 heads out of 1,845,200 pigeons or 56.1% were raised also in Tarai, see TABLE 11.3.

TABLE 11.1: NUMBER OF HOLDINGS WITH LIVESTOCK AND LIVESTOCK NUMBERS BY LIVESTOCK TYPE, NEPAL, 1981/82, 1991/92 AND 2001/02

Livestock type	Holdings (' 000)			Livestock (' 000)			Percent change

CHAPTER 12 ANCILLARY ACTIVITIES

The 2001/02 agricultural census also covered the ancillary activities carried out on agricultural holdings in relation to forestry and fishing. The holdings with woodland and forest were estimated to be 204.8 thousand in 2001/02 which was 6.1 percent of the total holdings. Between 1981/82 and 1991/92 there was big increase in the number of holdings with woodland and forest. The number of such holdings had increased from 88.9 thousand to 439.6 thousand holdings, an increase of 394.5 percent in 10 years. The period between 1991/92 and 2001/02 registered decline in woodland and forest area from 439.6 thousand hectares to 204.8

thousand hectares only – a decrease of 46.6 percent.

Along with the number of holdings, area under woodland and forest had also increased in 1991/92 and decreased in 2001/02. In 1991/92, there was a large increase in the area of woodland and forest. From 15.0 thousand hectares in 1981/82 it increased to 108.8 thousand hectares in 1991/92. In 2001/02, the area under this category declined to 37.2 thousand hectares, a decrease of 65.8 percent compared to 1991/92. This area accounted for 23.8 percent of the total area of non-agricultural land in 2001/02.

Table 12.0 Summary Statistics

Description	1981/82	1991/92	2001/02
Holdings with woodland and forest land (' 000)	88.9	439.6	204.8
Total land holdings (' 000)	2,185.7	2,703.9	3,337.4
% with woodland/forest to total holdings	4.1	16.3	6.1
Area of woodland and forest (' 000 ha)	15.0	108.8	37.2
Average area per reporting holding (ha)	0.1687	0.2475	0.1816

12.1 Ancillary activities

The 2001/02 agriculture census covered ancillary activities carried out on the agricultural holdings specifically forestry and fishery activities undertaken simultaneously with agricultural activities.

An agricultural holding is composed of agricultural and non-agricultural lands. Ponds usually used in raising aquatic animals and plants are part of agricultural land while forestry activities are undertaken in the non-agricultural land portion of the holding under woodland and forest.

12.2 Forestry activities

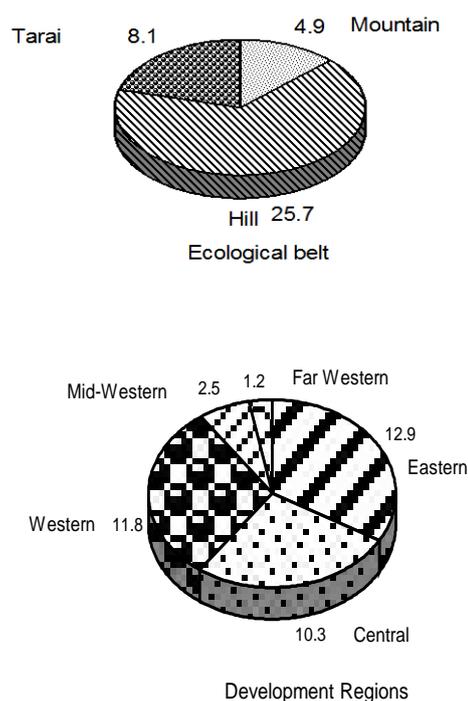

Holdings with forestry activities are those that reported the use of land under woodland and forest during the census years and those holdings that reported some forest trees within the holding. TABLE 12.1 shows the number of agricultural holdings with forestry activities in compact forest area from 1961/62 to 2001/02 or a period of forty years and TABLE 12.2 shows the total number of holdings with forest trees on the holding for 1991/92 and 2001/02.

12.3 Compact forest area

Between 1961/62 to 1971/72, there was a big decrease in the number of holdings with compact forest area not only proportionally to the total number of agricultural holdings but also in the actual number of holdings reporting forestry activities. In 1961/62 there were 150,000 holdings with compact forest area.. This was 9.9% of the total holdings during that year. In 1971/72, or ten years later, the number of holdings with compact forest area decreased to 50,700. This was only 3% of the total holdings during the period but the decrease was 66.2% over the 1961/62 figure. In 1981/82, there was an increase in the number of holdings to 88,900, equivalent to 4.1% of

the total holdings during that year. The increase in the number of holdings between the two census periods was 75.3% or an annual average increment of 7.5%. In 1991/92, a tremendous increase was observed at 439,600 holdings. This was 16.3% of the total holdings during the period and an increase of 394.5% over the number of holdings with compact forest area in 1981/82. In 2001/02 the number of holdings with compact forest area was even less than half that of 1991/92 level (204,800 only vs. 439,600). Except for 1961/62, the proportion of the holdings with compact forest area during the past 30

FIGURE 12.1: NUMBER OF FOREST TREES, 2001/02 (Millions)

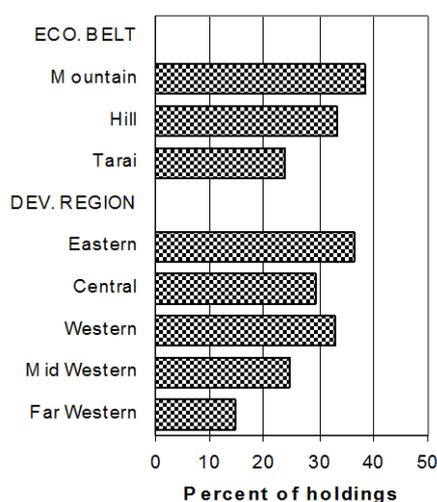

years had been observed to be increasing. However, in 2001/02, there was again a sudden decrease in the proportion of holdings engaged in forestry activities, from 16.3% in 1991/92 to only 6.1% of the total holdings in 2001/02. This 6.1% increase can be considered as within the

trend of previous census years, i.e. 3% in 1971/72; 4.1% in 1981/82. It was only in 1991/92 that there was an abnormal increase in the number of holdings with compact forest area that resulted also in an abnormal increase in the area of woodland and forest at 108,800 hectares compared with only 15,000 hectares of compact forest area in 1981/82 and 37,200 hectares in 2001/02, see TABLE 12.1.

12.4 Holdings with forest trees

In 2001/02, there were 988,700 holdings that reported having forest trees scattered within their agricultural holding. This number represented 29.6% of the total land holdings of 3,337,400 in 2001/02. The proportion of holdings with some forest trees in 1991/92 was higher at 39.9% and the number of holdings with forestry activities was also higher which was more than a million, see TABLE 12.2.

FIGURE 12.2: HOLDINGS WITH FOREST TREES, 1991/92

12.5 Area of woodland and forest

In Chapter 5 Land Use, the non-agricultural land portion of the holdings had been increasing but the trend on the area under woodland and forest did not seem to follow the same trend and can be considered erratic.

The area under woodland and forest is an indication of compact forest area where the trees were systematically planted. Since these are lands within the boundary of the agricultural holding, the compact forest areas therefore were not part of the commercial forest.

In 1961/62 the total area of woodland and forest was 13,800 hectares. This area was 23.4% of the total area of non-agricultural land in Nepal.

In 1971/72, the area under woodland and forest decreased to only 4,700 hectares which was 7.6% only of the total non-agricultural land during the period. In 1981/82, the area increased to 15,000 hectares, which was 14.4% of the total non-agricultural land during the period. However, there was an increase of 219% over the area ten years back.

In 1991/92, there was an abrupt increase in the area under woodland and forest to 108,800 hectares. This area was 53.2% of the total area of non-agricultural land during the year. The increase in area between 1981/82 to 1991/92 was 625.3%, which can be considered as abnormally high. In 2001/02, the area under woodland and forest decreased to 37,200 hectares, a decrease of 65.8% from ten years ago. This area, however, was 23.8% of the total area reported under non-agricultural land in 2001/02.

Except for the data on area in 1991/92, it can be said that in general, there has been a steady increase in the area under woodland and forest as part of the holding in Nepal as indicated by the average area per holding reflected in TABLE 12.1, starting from 0.0920 hectare in 1961/62 to 0.1687 hectare in 1981/82 to 0.1816 hectare in 2001/02. This increasing trend of area of woodland and forest is indicative of the slowly changing structure of the land comprising the agricultural land holding in Nepal.

Among the ecological belt, Tarai belt displayed a big decrease in the number of holdings with forest trees from 407,200 in 1991/92 to 348,500 in 2001/02, a decrease of 14.4% compared with a decrease of only 4% in Hill belt and 7.6% in Mountain belt.

12.6 Distribution of Forest Trees

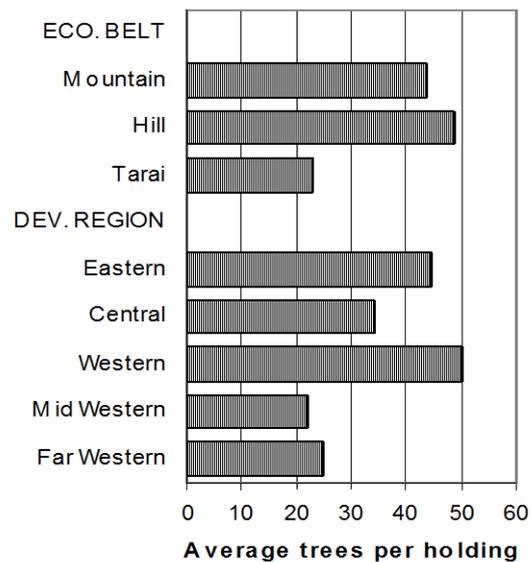

In 2001/02, there were 38.684 million trees reported by holdings not belonging to the compact forest area-type of holding. The density of forested holdings was 39 trees per holding in 2001/02, up by 25% over the 1991/92 density of 31 trees. Hill belt reported the highest average density of 49 trees per holding in 2001/02 followed by Mountain belt with 43 trees per holding. In 1991/92, the highest average was 37 trees per holding also in Hill belt. Mountain and Tarai belts had the same density of 25 forest trees per holding

The large holdings reported the highest average of forest trees per holding in 2001/02 of 93 trees and the small holdings reported only 16 forest trees per holding.

Proportionally, the large holdings also reported the highest proportion of holdings with forest trees and the small holdings, the lowest.

In terms of the number of trees per holding, about 21.4% of the holdings reported at least 50 forest trees in hill belt while the Mountain belt reported a slightly lower

FIGURE 12.3: AVERAGE TREES PER FORESTED HOLDING, 1991/92

percentage of 21.2%. Tarai belt reported only 9% of the holdings with at least 50 forest trees in their holding.

12.7 Fishery activities

Fishing is not yet popular among agricultural holders in Nepal. Of the 3.337 million holdings only 12,700 holdings has ponds in 2001/02 with an aggregate area of 5,700 hectares. Ten years ago, there were 11,500 holdings with ponds, an increase of 10.4%.

Other fishing activities were reported by 9,500 holdings or 0.3% of the total land holdings in 2001/02. Ten years ago, the number of holdings was 1,500 only.

CHAPTER 13 NON-RESIDENTIAL BUILDINGS

In 2001/02, there were 1490.9 thousand holdings which reported having non-residential building used for keeping livestock. This accounted for 44.7 percent of the total agricultural holdings. Poultry keeping building was estimated to be 160.1 thousand in 2001/02. Between 1991/92 and 2001/02, a non-residential buildings used for keeping livestock had increased by 20.4 percent. Similarly, building used for keeping

poultry also increased by 65.7 percent during the same period.

Number of non-residential building used for storage has decreased in 2001/02 compared to that of 1991/92. The census 2001/02 estimates the number of such building to be just 76.9 thousand. The holdings with at least one non-residential building were 54.3 percent of the total land holdings.

Table 13.0 Summary Statistics

Main Use	Number of Land Holding ('000)	
	1991/92	2001/02
Keeping Livestock	1,238.2	1,490.9
Keeping Poultry	96.6	160.1
Storage of agriculture. produce	91.1	76.9
Other purpose	132.0	84.7
Total Land holdings of Nepal	2,703.9	3,337.4

13.1 Non-residential building

For the purpose of agriculture census, only non-residential buildings entirely or primarily intended for agricultural use such as warehouses, poultry house, pig pen, stable, etc. were included.

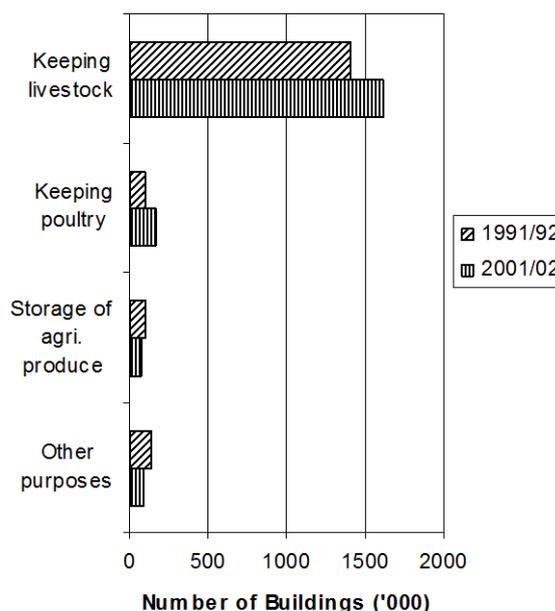

A building is defined as any independent free-standing structure comprising one or more rooms or other spaces covered by a roof and usually enclosed within external walls or dividing walls which extended from the foundations to the roof. A non-residential building that was used for storing agricultural produce and at the same time the family of the holder reside in this building was not considered as non-residential building because the building was not used solely for agricultural purpose.

13.2 Holdings with non-residential buildings

There were three major types of non-residential buildings that were mostly reported by the holdings, these are: buildings for keeping livestock, building for keeping poultry, and building for storing agricultural produce. There were other types of building but the number was insignificant thus were classified under “other purposes.”

Of the 3.3 million holdings in 2001/02, 1.5 million holdings or 44.7% of the total reported of having a non-residential building used for keeping livestock; 160,100 holdings or 4.8% with building for keeping poultry; 76,900 holdings or 2.3% with building for storage of agriculture produce; and 84,700 holdings or 2.5% with buildings used for other purposes.

FIGURE 13.1: TYPES OF NON-RESIDENTIAL BUILDINGS, NEPAL, 1991/92 AND 2001/02

The aggregate total of holdings with at least one non-residential building was 54.3% of the total or about 1.8 million holdings.

Proportionally, Hill belt reported the highest percentage of holdings with building for keeping livestock at 49% while Mountain belt reported the lowest with 37.1%, but it reported the highest percentage of building for keeping poultry. On the other hand, Tarai reported the highest ownership of building for storage of agricultural produce, see TABLE 13.1.

Western and Eastern regions reported the highest proportion of ownership of building for keeping livestock at 59.6% and 59.3%, respectively.

The chart above shows a comparative number of buildings in 1991/92 and 2001/02. There was an increase in buildings for keeping livestock and poultry but a decrease for storage of agricultural produce and for other purposes.

CHAPTER 14

HOLDINGS WITH CREDIT

Of the 3364.1 thousand agricultural holdings in Nepal in 2001/02, only 801.3 thousand holdings or 23.8 percent had taken advantage of loan or credit facilities from different sources. In 1991/92, some 22.7 percent holdings of the total holdings had reported of having availed of loans or credit facilities from different sources. Over the decade

between 1991/92 and 2001/02 there was an increase of 1.1 percent. The main source of credit reported in 2001/02 was non-institutional sources. There were 481.9 thousand holding (60.1% of the total holdings) with loan from this source. In 1991/92, some 51.0 percent holding had credit or loan from institutional sources.

Table 14.0 Summary Statistics

Source	Number of Holdings ('000)	
	1991/92	2001/02
1. Sajha only	43.0	33.5
2. Agriculture Development Bank only	205.0	228.0
3. Commercial Bank only	44.6	35.0
4. Non-institutional only	306.0	481.9
5. More than one sources	23.6	22.9
Total holdings with credit	622.2	801.3

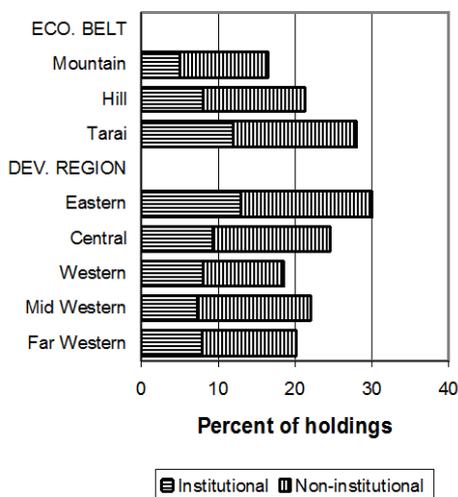

14.1 Agricultural Credit

Information on agricultural credit was collected in 1991/92 and in 2001/02 census of agriculture. Agricultural credit is not usually collected in a census but the information is important to policy makers and program implementers in agriculture. A question was asked whether each agricultural holding had an existing agricultural loan or not. If there is a loan, the source from where the loan was obtained was also asked.

14.2 Holdings with credit

Of the 3,364,100 agricultural holdings of Nepal in 2001/02, only 801,300 holdings or 23.8% had reported of having a loan or

FIGURE 14.1: HOLDINGS WITH AGRICULTURAL CREDIT, 2001/02

credit from several sources. There was a slight increase from those who had loans in 1991/92 at 22.7% of the total holdings of 2,726,100.

The main source of credit reported in 2001/02 was non-institutional sources with 481,900 holdings or 60.1% of the total holdings with loans (801,300). In 1991/92, the main source of credit of the majority of the holdings (about 51%) with loans was from institutional sources. The ten

percentage points difference indicated a shift of the sources of credit from institutional sources to non-institutional sources.

14.3 Regional comparisons

Among the ecological belt, Tarai reported the highest proportion of agricultural holdings with credit at 28% of the total holdings of 1,479,500 in 2001/02. In 1991/92, the proportion of holdings with credit was 26.8% of the total. Mountain belt reported the lowest proportion of holdings with loans, at 16.5% of the total in 2001/02. This percentage was lower than that of 1991/92, which was 18.6%. In the Hill belt area, the proportion of holdings with loans was 21.3% of the total in 2001/02 and in 1991/92, it was lower at 20.2%.

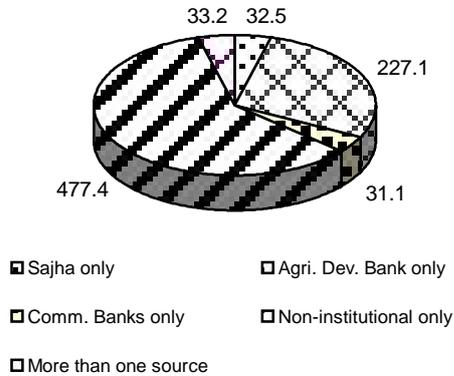

Eastern region reported the highest proportion of holdings with loans at 27.9% of the total and Far-Western region reported the least with only 15.3% of the total holdings with loans.

14.4 Source of credit

There were four specific sources of credit reported by the agricultural holdings in 1991/92 as well as in 2001/02. The only difference was the extent of availing of the specific source of loan. The sources of credit in 2001/02 in the order of importance were: Non-institutional source, 60.1%; Agricultural Development Bank (ADB), 30.9%; Sajha, 6.4% and Commercial banks, 5.5%, see TABLE !4.3.

It may be noted that those holdings that availed of loans from ADB only was 28.5% and the rest (2.4%) of the borrowers from ADB had also loans from other sources, i.e. 1.7% of the holdings borrowed also from Sajha and 0.6% in combination with commercial banks. This was also true for holdings that borrowed from commercial

FIGURE 14.2: HOLDINGS WITH CREDIT, NEPAL, 2001/02, SOURCE OF CREDIT ('000)

banks where only 4.4% reported Commercial banks as their only source of credit while 0.6% of them also availed of the ADB aside from their loan from commercial banks. The same is also true for Sajha borrowers where only 4.2% of the total holdings was the only source of credit; about 1.7% borrowed from ADB in combination with Sajha and 0.4% in combination with commercial banks.

It should be noted that the percentage of borrowers from ADB, commercial banks and Sajha decreased in 2001/02 when compared with the levels of borrowers from the same sources in 1991/92.

14.5 Comparisons of small and large holdings

As the size of the holding becomes bigger, the proportion of holdings availing of credit from institutional sources increases and the proportion of borrowers from non-institutional sources decreases. In 2001/02, only 6.1% of small holdings borrowed from institutional sources while the large holdings registered a 20.7% availment. On the other hand, 15.6% of the small holdings borrowed from non-institutional sources while only 10.3% among large holdings availed of this source.

CHAPTER 15

CHARACTERISTICS OF AGRICULTURAL HOLDERS AND AGRICULTURAL HOLDINGS

At the national level 91.9 percent of the holdings had male holders and 8.1 percent had female holders in 2001/02. The female holders increased from 6.4 percent in 1991/92 to 8.1 percent in 2001/02 and relatively the male holders decreased to 91.9 percent during the same period.

There seems to be marked difference between the size of holding operated by male and female holder. The average size of holdings operated by female holders in 2001/02 was 0.53 hectares per holding while that of the male holders had much higher average of 0.81 hectares per holdings.

The average sizes of holding in 2001/02 was lower than that in 1991/92. The female holders in 2001/02 had an average size of 0.66 hectare and male had an average of 0.98 hectares per holdings. For both the sex, the average size of holding was 0.96 in 1991/92.

At the national level, 78.2 percent of the total holdings reported that their agricultural

produce was used only for household consumption while 21.6 percent of the holdings used for both purposes- consumption and sale.

In 2001/02 about 39.8 percent of the total holdings reported that their agricultural produce was sufficient to feed the household throughout the agricultural year while some 60.2 percent of the total holdings reported that their produce was insufficient to feed the household for the whole year.

The information obtained on the area of soil type in 2001/02 agricultural census is: the loam comprised of 884.7 thousand hectares, sandy soil comprised of 589.5 thousand hectares and clay soil comprised of 532.5 thousand hectares which accounts for 33.3 percent, 22.2 percent and 20.1 percent respectively of total land. The silt and clay loam type of soil are not much prevalent as they cover only 6.3 percent and 5.5 percent of the total land.

Table 15.0 Summary Statistics

Description	1991/92	2001/02
A. Percentage of Male Agricultural holders	93.6	91.9
Percentage of Female Agricultural holders	6.4	8.1
B. Average size of Male holdings	0.98	0.81
Average size of Female holdings	0.66	0.53
C. Use of produce of the holdings (%)		
a. Home consumption	-	78.2
b. Home consumption and sale both	-	21.8
D. Sufficiency / Insufficiency of agricultural produce (%)		
a. Sufficient to feed household	-	39.8
b. Insufficient to feed household	-	60.2
E. Area of holding by soil type (%)		
a. Sand	-	22.2
b. Loam	-	33.3
c. Silt	-	6.3
d. Clay	-	20.1
e. Clay Loam	-	5.5

15.1 Characteristics of agricultural holders

This chapter presents some characteristics of agricultural holders in Nepal and additional information about agricultural holdings that were not discussed in the previous chapters of this report. For the first time in the history of agriculture census taking in Nepal, additional information were collected on the main use of produce of holding, sufficiency and insufficiency of agricultural produce to gauge food security including coping mechanism if agricultural produce was insufficient, headship of household, holding with hired manager, soil type and color, land made uncultivable due to flood or soil erosion and ethnicity of the agricultural holders. The analyses of the additional information gathered are included in this chapter.

An agricultural holder for the purpose of the census is the person in the agricultural holding who makes major decisions regarding the use of resources and has technical and economic responsibility for the holding. He/she exercises management controls over the operations of the holding and may undertake directly or delegate the day-to-day supervision of the operations of the holding.

In Nepal, the agricultural holder is usually the same person as the household head. The agricultural holder was identified on the basis of the person acknowledged by household members as the primary decision-maker on matters relating to the operations of the holding.

On the other hand, an agricultural holding, for the purpose of the census, is defined as

an economic unit of agricultural production under single management comprising all livestock and poultry kept and all land used wholly or partly for agricultural production purposes. A holding was considered to be an agricultural unit of production if it satisfies any of the following conditions:

- having an area under crops of at least a quarter of ropani (or four annas) or one matomuri in Hill or Mountain districts (0.01272 hectares) or at least eight dhur (0.01355 hectares) in Tarai; or,
- keeping at least two heads of cattle or buffaloes; or,
- keeping at least five heads of sheep or goats; or,
- keeping at least 20 heads of poultry; or,
- keeping any combination of livestock and poultry equivalent to 2 animal units.

The above definitions of an agricultural holder and agricultural holding may serve as a backgrounder in understanding the census results that are presented.

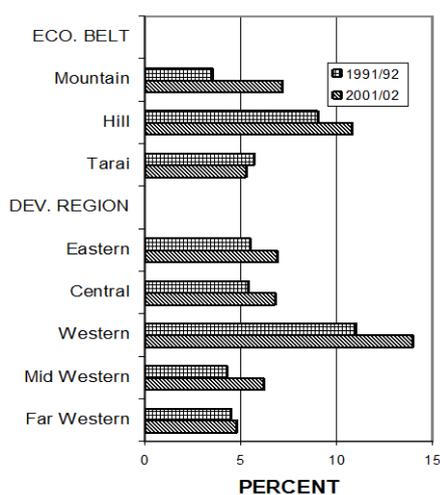

15.2 Sex of holder

Of the 3.36 million agricultural holders in 2001/02, there were 271,500 female holders representing 8.1% of the total. This is 1.7 percentage points higher than the proportion of female holders in 1991/91, which was 6.4% of the total holdings, see TABLE 15.1.

In terms of number, there was an increase of holdings operated by females from 175,600 in 1991/92 to 271,500 holdings, an increase in the number of female holders by 54.6% in a span of ten years.

Hill belt reported the highest percentage of female holders in 2001/02, which was 10.8% of the total holdings followed by Mountain belt with 7.2%. Tarai belt reported the lowest percentage of 5.3% but the number of female holders is much more than those in Mountain belt, which was only 21,400 female holders compared with 78,300 in Tarai, see TABLE 15.3

FIGURE 15.1: FEMALE HOLDERS, 1991/92 AND 2001/02

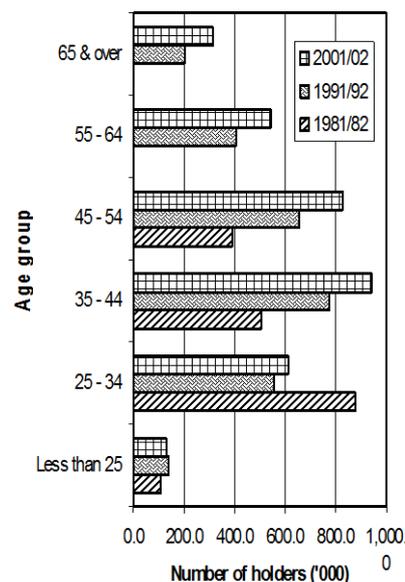

Western region reported the highest proportion of female holders among development regions at 14% and also the highest number of 100,000 female holders followed by Eastern region with 6.9% and Central region with 6.8%. Mid-Western region reported a bit lower at 6.2% and Far-Western region reported the least proportion of 4.8%, see TABLE 15.5.

15.3 Age of holder

The modal age of the holders is on the rise. In 1981/82 the modal age was in the age group 25-34 where 40% of the holders belong. The median age during this period was 35.12 years. In 1991/92, the modal age shifted to age group 35 – 44 where

FIGURE 15.2 HOLDERS BY AGE, NEPAL, 1981-2001

28.3% of the holders belong and those above 45 consisted of 46.3%. The median age was 43.57 years, which is 24% higher than ten years ago.

In 2001/02, the modal age falls in the same age group as in 1991/92 but the percentage of holders belonging to this group was only 28%, which was a little bit lower than in 1991/92 but those in the age group above 45 was higher (50.1%). The median age was also a little bit higher at 44.92 years, an increase of only 3.1% over that of 1991/92.

The modal age for both the male and female holders is the same, 35 – 44 age group. However, the median age of the female holders is higher, which was 54.5 years compared with only 44.88 years for the male holders, a difference of almost 10 years. This suggests that women have to be elderly to become a holder.

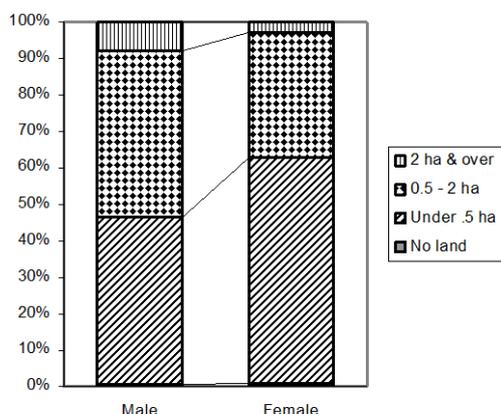

The three belts exhibited the same modal age group of 35-44 years, see TABLE 15.4. The same holds true for the five development regions where the modal age

group was also 35-44 years, see TABLE 15.6.

15.4 Size of holding per holder

The average size of holdings operated by females in 2001/02 was 0.53 hectare per holding while that of the male holders reported a much higher average of 0.82 hectare per holding. The overall average of the holdings for both sexes was 0.79 hectare, see TABLE 15.1. These average sizes were lower than those in 1991/92 where the female holders then had an average size of 0.66 hectare while the male holder had an average size of 0.98 hectare per holding. For both sexes, the average size of the holding was 0.96 hectare.

FIGURE 15.3: MALE AND FEMALE HOLDERS BY SIZE OF HOLDING, NEPAL, 2001/02

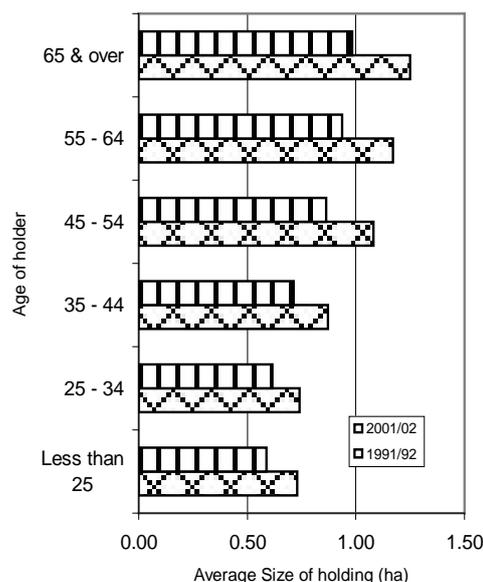

Among the three broad groups of holding sizes, holdings with less than 0.5 hectare (small holdings) reported the highest proportion of female holders at 10.7%. Large holdings of at least 2 hectares reported the lowest proportion of female holders, which were only 3.1% of the total.

Among female holders, 62% had a holding area of less than 0.5 hectare while only 2.9% had large holdings. There were 2,500 holders or 0.9% that did not have any land.

Among male holders, large holdings (at least 2 hectares) comprised 8% while holdings without land consisted of 0.8%. Holders of small holdings with an area of less than 0.5 hectare and holdings with an area of 0.5 hectare to less than two hectares

FIGURE 15.4: AGE OF HOLDER BY AVERAGE SIZE OF HOLDING, NEPAL, 1991-2001

(medium size) had an equal share of 45.6% each. The holders of large holdings reported a higher modal age group of 45-54 than the small and medium-sized holdings whose modal age group was 35-44. The highest median age of 50.5 years was also reported by the holders of large holdings compared with 42.6 years for holders of small holdings. The medium-sized holdings had a median age of 46.7 years. Based on this trend we can say that there is a positive relationship between the age of the holder and the size of the holding, i.e. as the size of the holding increases, the median age of the holder also increases.

15.5 Headship of household

The holder of an agricultural holding is most likely the head of the household. This

is borne by the fact that 97.5% of the holders were the head of their households. There was a slight difference in the headship of households in holdings with land and without land where 98% of the holders without land holdings were household heads compared with 97.5% holders with land holdings were household heads. Only 2.5% of the households reported “other” person than the holder as the head of the household see TABLE 15.9. The female holders reported a lower proportion of being a household head (94.3%) than the male holders of whom 97.7% were reported as household head. Holdings without land reported a higher proportion of the holders being household head (98.4%), see TABLE 15.9.

The percentage of male holders being household head decreases as the size of their holding increases. The reverse was observed among female holders, i.e. as the area of the holding increases, the percentage of female holders as household head also increases

Among ecological belt, Mountain belt holders reported the highest incidence of being household head (98.7%) compared with Hill belt and Tarai belt holders with 97.4% and 97.3%, respectively.

For development regions, only Mid-Western region holders reported more than 98% as head of the household. Far-Western region holders reported headship of the household above the national average (97.6%) while the other three regions had proportion of holders being head lower than the national average, see TABLE 15.10.

15.6 Hired manager

A hired manager is a person who takes technical and administrative responsibilities in the management of a holding on the holder’s behalf. He/she supervises the day to day operations of the holding including the decisions made attendant to such operations including managing and supervising the work of hire labour. He/she may be paid in cash or in kind for his/her compensation.

There were only 7,837 holdings, equivalent to only 0.23% of the total, with a hired manager in 2001/02. Of this number, 104 holdings or 1.33% were without land and 7,733 holdings or 98.67% were with land.

By size of holding, 2,615 belonged to less than 0.5 hectare land holdings which is 33.8% of the total; 2,108 belonged to the large holdings which is about 27.3% and the rest, 3,010 holdings belonged to the medium-sized land holdings. Furthermore, the large holdings reported the highest percentage with hired manager relative to the total, which was 0.83% and the small holdings reported the lowest with 0.17% of the total.

The proportion of the female holders with hired managers was higher than the proportion of male holders to the total, (0.32% vs. 0.23%).

Tarai belt holdings reported the highest percentage of hired managers which was 66.7% of the total hired managers, followed by Hill belt with 2,136 hired

managers or 27.3% of the total hired managers. Proportionally, relative to the region's total, Mountain belt reported a higher percentage of 0.16% compared with 0.13% for Hill belt.

Eastern region reported the highest proportion of holdings with hired manager (30.7%) followed by Central region with 24.2%.

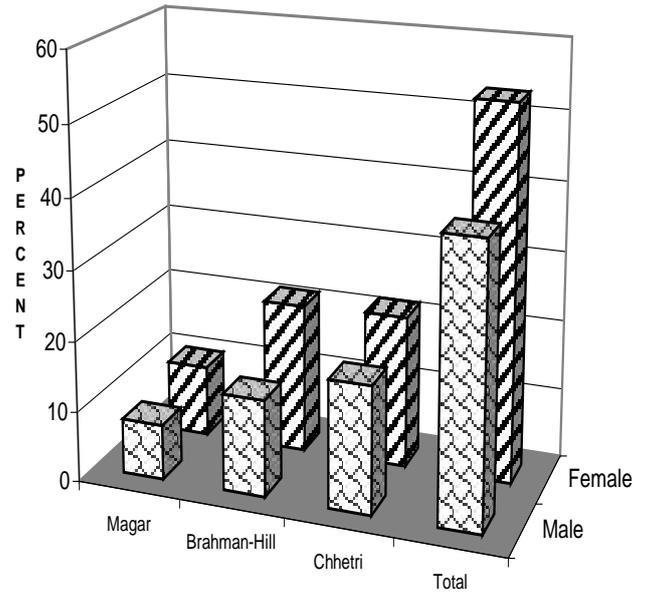

15.7 Ethnicity

The census of agriculture was able to record more than 85 different ethnic groups with sizeable responses from the holders found in the different geographic belts and regions of Nepal. The top three ethnic groups that were common to both the male and female holders in 2001/02 are: Chhetri, Brahman-Hill and Magar.

The female holders reported a higher proportion belonging to Chhetri ethnic group, which was 21.7% of the total female holders compared with 18.0% for the male holders. The second most popular ethnic group reported by the female holders is Brahman-Hill with 21.3% compared with 13.7% for the male. The third ranking ethnic group is Magar with the female holders reporting a higher percentage of 10.16% compared with 7.83% reported by the male holders. For these three ethnic groups, the female holders accounted for a total of 53.1% while that of the male holders, only 39.6%.

The fourth ranking ethnic group among female holders is Kami with 6.2% while that of the male holders is Tamang-Murmi with 6.34%. This ethnic group is the fifth most popular reported by female holders with 5.8% while the fifth ranking ethnic

FIGURE 15.5: TOP THREE ETHNIC GROUPS OF NEPAL BY SEX OF HOLDER, 2001/02

group among male holders is Tharu with 6.0%.

As a whole, 65.1% of the total female holders belong to only 5 major ethnic groups of the more than 85 ethnic groups of Nepal while majority (52%) of the male holders belong to the 5 top-ranking ethnic groups recorded. For other ethnic groups, see TABLE 15.11.

15.8 Ethnicity in ecological belt

The top 5 ethnic groups reported by holders in the three ecological belts consisted more than half of the total male and female holders except in Tarai belt where the top 5 ethnic groups reported by the males consisted only of 49.8% of the total.

The top 4 ethnic group reported in Mountain belt both for male and female holders consisted of more than 50% of the holders belonging to the following ethnic group: Chhetri, Tamang/Murmi, Brahman-Hill, and Kami. The fifth ranking group among male holders is Thakuri with 5.1%

and the fifth group reported by the females is Gurung with 5.8%.

For the Hill belt holders, the four ethnic groups reported both by the male and female holders were: Chhetri, Brahman-Hill, Magar, and Kami. The fifth most popular among the male holders was Tamang/Muri and for the female holders, Newar ethnic group.

In Tarai belt the ethnic groups reported by the male holders differ in importance as compared with the report of the female holders. In fact, the Tarai belt ethnic group ranking is not similar with the other belts. The male holders reported the following ethnic group according to popularity: Tharu (13%); Brahman-Hill (11.3%); Yadav, Ahir, Gwala (10.1%); Chhetri (9.4%); and Musalman, Muslim (6.0). For the female holder, the ethnic groups according to the order of popularity were: Brahman-Hill (22.7%); Chhetri (15.4%); Magar (6.9%); Tharu (5.2%); Yadav, Ahir, Gwala (5.%)

15.9 Ethnicity in development region

Male and female holders in Western region belong to the same top five ethnic groups, namely: Brahman-Hill, Magar, Chhetri, Kami and Gurung. In contrast, male and female holders in Far-Western region reported very different ethnic grouping for the top five. The male holders belong to a different ethnic group not only from the female holders within the region but also with other development regions. These ethnic groups are: Teli (44.7%); Sikh/Panjavi (13.8%); Dhanuk (13.1%); Gaine/Gandharbha (10.9%); and Thakali (4.8%). The female holders reported the following ethnic groups which are similar

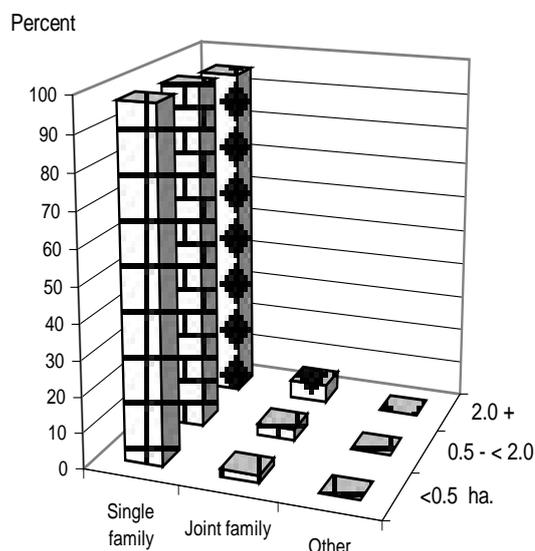

to the other regions except one: Chhetri (45.3%); Brahman-Hill (16.2%); Kami ((14.1%); Thakuri (6.1%) and Damai/Dholi (3.4%). The total holders belonging to the top five ethnic groups in Far-Western region consisted of 85% for the female holders and 87.3% for the male holders.

For the other three development regions, four out of the top five ethnic groups are the same for the male and female holders, see TABLE 15.13.

15.10 Legal status of holding/holder

The term legal status is not necessarily confined to the legal characteristics of the holder but concerns broader aspects of identifying specific types of holdings. In Nepal, the holding is operated as a family enterprise where the household members

FIGURE 15.6: LEGAL STATUS OF HOLDING BY SIZE OF HOLDING, NEPAL, 2001/02

assist in carrying out the agricultural operations. This is supported by the fact that 97.2% of the total holdings were a single family-operated enterprise. Only 2.8% of the holdings were operated jointly

with other families while less than 0.1% (0.04%) under other arrangements.

For holdings without land, the proportion of single family status of operation was lower at 96.4% compared with 97.2% for the holdings with land. By size of holding, the large holdings registered a lower percentage of single family type of legal status. Correspondingly, the proportion of large holdings being managed jointly with other families is higher (5.1%). The same trend is observed on the legal status of holdings operated both by females and males where the proportion of single family operating the holding tends to decrease as the size of the holding increases.

Among the three belts, Mountain belt holders reported the highest proportion of single family legal status of 98.9%. Tarai belt reported the lowest proportion of 96.8%. Correspondingly, it reported the highest proportion of joint family status of 3.1%. 'Other' legal status is negligible in the three belts.

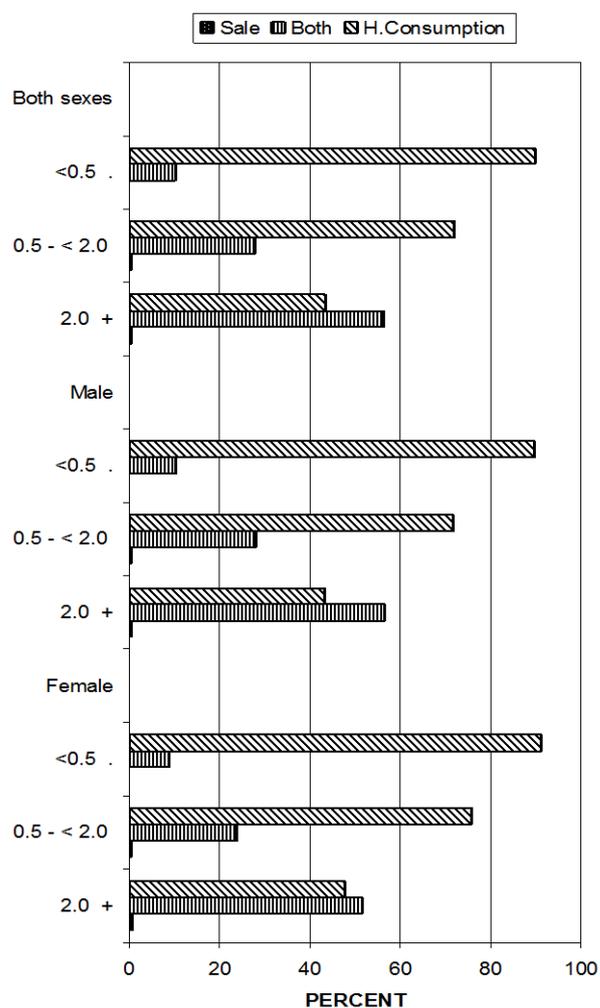

Among the development regions, Far-Western region reported the lowest percentage of single family legal status at 95.3% and the highest percentage of holdings with joint family status at 4.7%. Western region reported the highest proportion of holdings under single family status at 98.1% followed by Central region at 97.8%. Eastern and Mid-Western regions had the same proportion of holders under single family status in the operation of the holding.

15.11 Main use of produce of holding

A question was asked on the purpose of production of the holding whether it is mainly for sale or for home consumption.

Mainly means more than half of the agricultural production of the holding is for

FIGURE 15.7: MAIN USE OF PRODUCE BY SEX OF HOLDER AND SIZE OF HOLDING, NEPAL, 2001/02

sale or for home consumption. If the purpose is equal in usage of the agricultural produce the response is 'Both'.

At the national level, 78.2% of the holdings responded that their agricultural production was mainly for home consumption. These are the holdings that are engaged in subsistence farming. Only 0.2% or 8,091 holdings of the total reported their produce to be mainly for sale while 21.6% of the holdings was both for sale and for home consumption.

Most small holdings produce for home consumption. It may be noted, however, that a greater portion of the agricultural produces of large farms (2 hectares and over in size) were for sale and home consumption with the following proportion: large male holdings, 56.5% and large female holdings, 51.6%.

It is also observed that the proportion of holdings without land in terms of home consumption is lower for the female holders ((74.3%) than the male holders (82.1%). This trend is also true for holdings that are both selling and using their produce for home consumption where the proportion among female holders was higher (24.6%) than the male holders of holdings without land (15.9%), see TABLE 15.16.

Tarai belt reported the greatest number of holdings that the agricultural produce is mainly for sale. Out of the 8,091 holdings that reported their produce mainly for sale, 4,727 holdings or 58.4% were from Tarai belt. Of this number, only 261 holdings or 5.5% of those in Tarai belt were operated by females. It may be significant to note, however, that among female holders, the hill belt reported the highest number of female holders who dispose of their produce mainly for sale. In 2001/02 there were 457 female holders who disposed of their agricultural produce mainly for sale. This is 63.1% of the total female holders who dispose of their total holdings in Nepal whose main use was for sale, see TABLE 5.17.

Among development regions, majority of the holdings that disposed of their agricultural produce mainly for sale were in Central and Eastern regions although

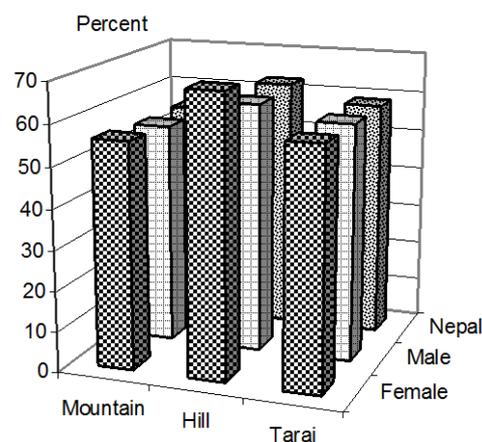

proportionally, Mid-Western region reported the highest proportion of 0.4% to the total number of holdings in this region.

15.12 Sufficiency of agricultural produce

The data that are presented here were based on responses of holdings to the questions asked relative to the sufficiency of agricultural produce for the consumption of the households. If the response to the question was not sufficient, additional questions were asked on the duration of insufficiency and the manner of coping with insufficiency.

In 2001/02, six out of 10 holdings reported that their agricultural produce was not sufficient to feed their household until the next harvest. The situation among female holders is worse since 65.1% of the total female holders reported the insufficiency of agricultural produce from their holdings during the year.

FIGURE 15.8: HOLDINGS WITH INSUFFICIENT AGRICULTURAL PRODUCE BY SEX OF HOLDER, NEPAL, 2001/02

By ecological belt, the holders in the Hill belt reported the highest proportion of food

insufficiency from their holdings, which was about 62% compared with 56% in Mountain belt and 59% in Tarai.

Among female holders, the proportion of insufficiency of agricultural produce was even higher at 69% in Hill belt compared with 62% among the male holders. The insufficiency of produce in Tarai for the male and female holders was at the same level of about 59%. In the Mountain belt, a one percentage point difference was noted in favor of the male, i.e. the male holders reported a lower figure of insufficiency compared with the female holders, see TABLE 15.18.

Among the development regions, Mid-Western region reported the lowest percentage with insufficiency of agricultural produce to feed their family, which is 52.1% and second to the lowest, Far Western region with 53.7%. Western region reported the highest incidence of insufficiency of produce at 66.1%. The insufficiency is even much higher for female holders at 70.8%.

15.13 Number of months insufficient

Of the 2 million holdings with insufficient agricultural produce to feed their families, 43.3% said their insufficiency lasted for 4-6 months while 17.6% stated that the duration of insufficiency was from 10 to 12 months. By sex of holders, the female holders reported a higher percentage of those who had insufficiency of produce from the holding at 19.6% compared with 17.5% for the males. For the rest of the holders, the duration of insufficiency is similar for the 1-3months, 4-6 months and 7 to 9 months, see TABLE 15.18.

By ecological belt, Tarai belt holders reported the highest percentage of holdings with 10 to 12 months' duration of insufficiency (26.6%). A higher percentage among the female holders (31.5%) was observed having insufficiency of produce from the holding in Tarai belt compared with only 10.8% in Mountain belt and 15.9% in Hill belt area.

Female holdings in Eastern development region reported the highest proportion of holdings with the longest duration of insufficiency of 10 to 12 months at 23.2%, which is higher than the nationwide average of 17.6% and among all female holders with insufficiency average of 19.6%. It may be significant to note that the proportion of male holders with duration 9 to 12 months of insufficiency of produce was 0.2 percentage point higher than that of the female holders in Eastern region.

15.14 Manner of coping with insufficiency

Income within the district was reported by more than two-thirds of the holders with insufficiency of agricultural produce from the holding. The second mechanism to cope with insufficiency of produce to feed the family is earning income outside of Nepal with 13.1% responses.

By sex of holder, the female holders reported a higher percentage of getting income from outside Nepal with 21.1% compared with only 12.4% for the male holders. Other coping mechanism resorted to by holders both the males and females was borrowing with more than 10%; income within Nepal but outside the district

with 8.6% of the total holdings with insufficiency.

Among female holders, those in Hill Belt reported the highest percentage of coping with the insufficiency of produce through income outside Nepal with 24.7% compared with only 7.5% among those in the Mountain belt area and 15.4% in Tarai belt. However, Mountain belt female holders reported the highest proportion of resorting to income from district to augment the deficit with 72.5% compared with 68.1% in Hill belt and 70.8% in Tarai.

15.15 Soil type and color

Another important information that was gathered in the Census of Agriculture for the first time is the type of soil and color of the soil. These soil characteristics along with other information such as climate, rainfall and water availability form an important basis for agricultural planning. The soil type indicates the texture of the soil. Depending upon their mixture in the soil, the soil type can be divided into five or more groups, namely: sand, loam, silt, clay and clay-loam. In agriculture, the texture of the soil determines to a large extent what kind of crops can best be planted to give the best yield. Usually the texture of the soil determines its water holding capacity.

The information on the color of the soil to a certain extent can assist in assessing the origin of the topsoil.

The number of holdings reporting the type and color of soil may exceed the total number of holdings because within a holding, some parcels may have different types of soil.

The most popular soil type in Nepal is loam with almost 60% or 2 million holdings reporting. The second and third most commonly reported soil types were sand and clay with 43.3% and 39.1%, respectively

In terms of area, loam comprised of 884,697 hectares of land or 33.3% followed by sandy soil with 589,455 hectares or 22.2% of the total and clay soil with 532,488 hectares or 20.1% of the total land holding area.

The types of soil found in the three belts are similar even in terms of popularity although there is some slight differences in the percentages reported. The trend in the area by type of soil is also similar.

The prevailing color is brown where 62.2% reported followed by black with 55.9%. Red soil type is not significant in number Tarai belt where only 7.3% of the holding reported with an area of 3.1% of the total compared with 38.6% of red soil type in Hill belt with an area of 19.6% of the total area in this belt, see TABLE 15.20.

The three dominant soil types in the 5 development regions are the same, they only differ in the number of holdings reporting and the area of coverage of these three soil types. The three dominant soil types for the 5 regions in the order of reporting holders are: Eastern, Central, Mid-Western and Far Western regions – loam, sand and clay; and Western region – loam, clay and sand. The area of coverage is also in the same order of importance as in the soil type in the 5 regions, see TABLE 15.22.

15.16 Uncultivable area due to flood/soil erosion

The last characteristic of the holding that was gathered in the Census of Agriculture is the area made uncultivable due to flood or soil erosion. Take note that this information is closely related to the information on soil type and the terrain of the land holdings.

In agricultural year 2001, there were only 156,883 holdings that were seriously affected by floods or soil erosion. This number is 4.66% of the total holdings in Nepal. Holdings with insignificant area of land had also been subjected to these natural calamities and there were 215 holdings or less than 1% of the total. Of the holdings with land, there were 156,668 holdings affected that comprised 4.69% of the total land holdings.

By size of holdings, the large holdings reported the highest proportion of being victims of these natural calamities but the area affected was highest proportionally among the small land holdings, see TABLE 15.23.

By ecological belt, Tarai belt reported the highest proportion of the number of holdings affected by these natural calamities.

Furthermore, the total area made uncultivable was also reported the highest in Tarai, see TABLE 15.24.

By development regions, Eastern, Central and Western regions reported a little more than 5% of the total land holdings as the affected holdings with uncultivable area due to floods and soil erosion.

TABLE 15.1: NUMBER AND PERCENT OF HOLDERS BY SEX AND BY AGE, NEPAL, 1981/82, 1991/92 AND 2001/02

Sex and Age	No. of holders ('000)			Percentage distribution			Ave. holding size (ha)

CHAPTER 16

FARM POPULATION

The total farm population recorded in 2001/02 census of agriculture was 19032.5 thousand. Of these, 9385.8 thousand were males and 9646.7 thousand females. At national level the farm population consisted of 82 percent of total population in 2001/02. As compared to 1991/92, the percentage of farm population has decreased slightly. In 1991/92 the farm population was 88 percent of the total. The male and female populations comprised about 49.3 and 50.7 percent of total farm population in 2001/02.

The farm population has increased by 17 percent in ten year's period between 1991/92 and 2001/02. The sex ratio was 97 males per 100 females in 2001/02 while this was 109 males per 100 females in 1991/92. The average size of farm household was 5.9 persons in 1991/92. It decreased slightly to 5.7 persons in 2001/02. Tarai has the highest average size of 6 persons per farm household compared with 5.3 in the Hills and 5.4 in the Mountains.

Table 16.0 Summary Statistics

Description	1991/92	2001/02
A. Total population	18,491,097	23,151,423
a. Male	9,220,974	11,563,921
b. % of total population	49.9	49.9
c. Female	9,270,123	11,587,502
d. % of total population	50.1	50.1
B. Total farm population	16,258,200	19,032,500
a. % of total population	88	82
b. Males	8,496,800	9,385,817
c. % of farm population	52.3	49.3
d. Female	7,761,400	9,646,691
e. % of farm population	47.7	50.7
C. Sex ratio of farm population	109	97
D. Average size of farm household	5.9	5.7

16.1 Information on farm population

This chapter presents the farm population as collected in the Population Census 2001 of Nepal. The farm population consisted of all household members of agricultural holders as listed during the first phase operation of the Population Census 2001.

In Chapter 1 Background of this report, the population of Nepal has been presented to provide an overall picture of the total population, population distribution of the population in ecological belts and in development regions, population density and population growth of ecological belts and development regions, usual activity of the population 10 years old and over, employment rate, usual activity of employed persons, number of households, number of agricultural holdings and farm population of ecological belts and development regions including the number of households and average household size. Since the Census of Agriculture is directly linked with the Population Census 2001, special tabulations from the population census on farm population were obtained and are presented in this chapter. The farm population was also linked with the data of the census of agriculture to obtain information related to the holding.

16.2 Farm population

In 2001, the total population of Nepal as published in the national report on the Population Census 2001 of Nepal was 23,151,423 of whom 11,563,921 or 49.95% were males and 11,587,502 or 50.05% were females. The urban population consisted of 3,227,879 persons, which is 13.94% of the total population. The enumerated rural population was 19,509,055 persons of which about 19,032,500 persons or 97.6% comprised the farm population. Tarai belt farm population consisted of 8.7 million persons in 2001/02 which is 46.56% of the total farm

population of Nepal. Hill belt farm population comprised 45.19% while Mountain belt had 8.25% or about 1.6 million people.

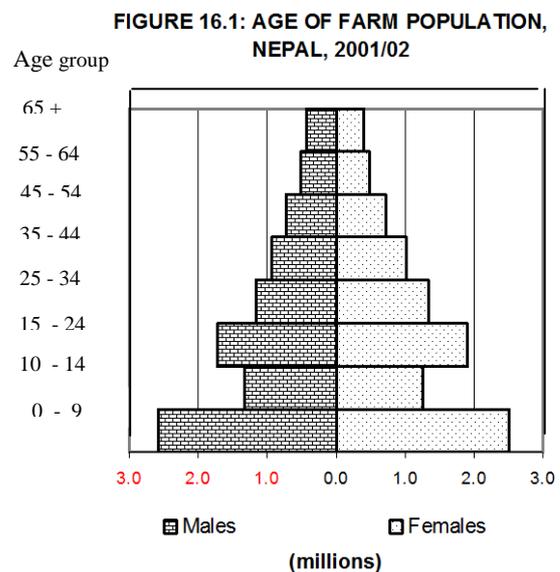

Among the sub-ecological belt regions, Central Tarai consisted of 16.1% of the total, which is more than 3 million people, see TABLE 16.2. The second most populous sub-region in Nepal in 2001/02 was Western Hill with 2.5 million people.

Among development regions, Central region was the most populous with farm population, see TABLE 16.4.

16.3 Age and sex structure

The age-sex pyramid of the population is reflected in Figure 16.1 above where the base of the pyramid consists of the young population 0 to 9 years old of about 5 million persons.

Based on the age group distribution, the

modal age group in 2001 aside from the base of the pyramid was 15 – 24 years old and the computed median age, where half of the population is above and half of the population is below this age was 17.6 years. In other words, the farm population of Nepal is considered young where half of

the population was below 17.6 years old compared with the nation's median age of 20.1 years in 2001.

If we look at the cumulative frequency distribution in TABLE 16.1, about 59.3% were aged below 25 years and 72.5% of the population were aged below 35 years old.

At the younger ages of 0 to 14, the males were dominant but as the age became older, the females dominated up to 44 years of age, then the shift of dominance goes back to the males where more than 50% of them were of ages 55 and over. This age composition of the farm population suggests that the life span of males in the farm is longer than the females where there were more males at the older ages than females.

The potential farm labour force comprised 61.4% of the total farm population. These are the members of the farm population who are at least 15 years old. The young dependency ratio was 72 young persons per 100 persons of productive ages 15 to 64 years while the old dependency ratio was 8 adult persons per 100 persons of productive age. The total dependency ratio, therefore, is 80 persons per 100 persons of productive ages 15 to 64.

16.4 Sex ratio

At the national level the sex ratio in 2001/02 was considered low where females outnumbered the males with a sex ratio of 97.3, i.e. there were 973 males for every 1000 females. It is on the age group of from 15 to 44 years of age where the females outnumbered the males. This age is considered the prime age for both males and females where the bulk of the labour force comes from. By ecological belt, Tarai belt reported the highest sex ratio of 102.4 which means that the males outnumbered the females in this area compared with 92.3 sex ratio in the Hill belt area. The low sex ratio is indicative of out-migration

of the male population. The Mountain belt also has a low sex ratio of 97.3, which is the same as the national average sex ratio.

Among the sub-ecological regions of Tarai belt, only Mid-Western Tarai reported less than 100 sex ratio but it is almost one-to-one, i.e. 996 males to 1000 females while Central Tarai reported the highest sex ratio of 105.6. Eastern Tarai, Western Tarai and Far Western Tarai reported a sex ratio of more than 100.

In the hill belt area, all sub-ecological regions reported low sex ratios. In fact the lowest sex ratio was reported in Western hill at 84.6. This means that there were more females in these sub-ecological regions.

In the Mountain belt area, only Mid-Western Mountain reported a high sex ratio of 104.1, and all the rest of the mountain regions have low sex ratios, see TABLE 16.2.

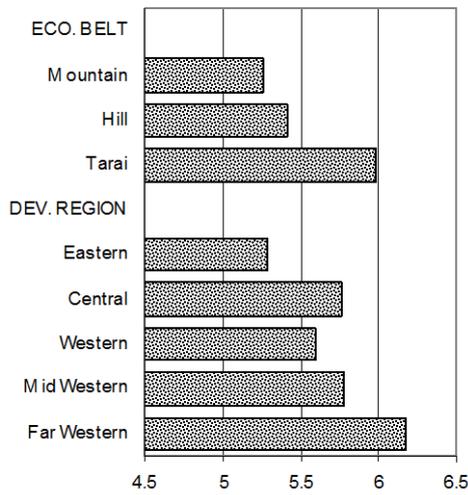

16.5 Household size

The average number of persons per holder's household was 5.7 in 2001, which was a little bit lower than in 1991/92 which was 5.9 persons per household. The national average household size for the entire population in Nepal in 2001 was 5.4 persons, lower than the average household size of the farm population.

Among ecological belt, Tarai belt yielded the highest average household size of 6 persons compared with 5.4 and 5.3 persons for Hill belt and Mountain belt, respectively. Central Mountain sub-ecological region exhibited the lowest average size of 4.8 persons while Far-Western Tarai reported the highest average household size of 6.9 persons.

For development regions, Far-Western region reported the highest average of 6.2 persons per household. This high average was attributed to the high average size of

FIGURE 16.2: AVERAGE HOUSEHOLD SIZE, 2001/02

households in Far-Western Tarai considering that Far Western Hill and Far-Western Mountain that comprise the development region reported only an average household size of 5.7 persons, see TABLE 16.4.

On the other hand, the development region that reported the lowest average household size in 2001 was the Eastern Development Region with 5.3 persons, which is much lower than the national average for the farm population.

16.6 Comparison of small and large holdings

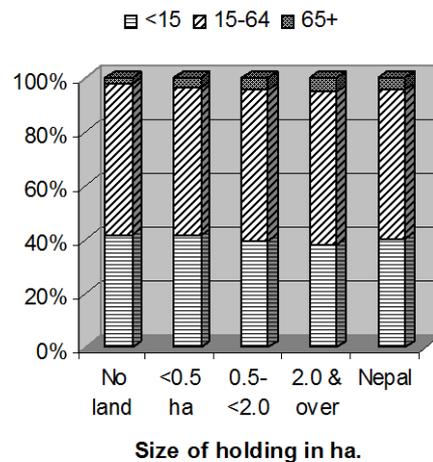

Holdings with no land and small holdings have similar population characteristics in terms of the age distribution of the farm population while the medium-sized and large holdings have similarity in the age structure of their farm population.

For ages less than 10 years old (0 – 9 years of age), the large and medium-sized holdings reported a much lower proportion than the small holdings and the holding with no land. Also for the farm population of less than 15 years old, the small holdings have higher proportion than the large holdings. In contrast, the proportion of the elderly population of 65 years and over

was higher among the large holdings than the small holdings. Furthermore, the proportion of the population belonging to the productive age of 15 to 64 years was slightly higher than the small holdings at 56.4% compared with 54.7% for the small holdings.

What is peculiar among the different holding sizes is the high average household

FIGURE 16.3: AGE DISTRIBUTION BY SIZE OF HOLDING, NEPAL, 2001

size for the large holdings. In 2001/02, the average household size for the large holdings was 7.8 persons compared with only 4.9 persons for holdings without land and 5 persons for small holdings. This observation was also true in 1991/92 where the average household size for the large holdings was 8.3 persons compared with 5.1 persons for the small holdings.

16.7 Some characteristics of districts

The top ten ranking districts on farm population are all found in Tarai belt. Four of these districts have a total farm population of more than half a million each. The top ten according to their farm population size are the following: (1) Rupandehi, 573,636; (2) Morang, 567,942; (3) Kailali, 552,297; (4) Nawalparasi, 505,991; (5) Dhanusha, 501,608; (6) Sarlahi, 489,948; (7) Jhapa, 480,418; (8) Bara, 456,508; (9) Siraha, 453,417; and (10) Rautahat, 445,183.

The district of Kavre with a farm population of 362,298 topped the population within the hill belt area but it ranked only 17th among all the districts of the country. The second top ranking district in Hill belt is the district of Dhading with a population of 328,814 but it is also ranked 22 in the overall ranking of districts on farm population size. It may be noted that most of the top ranking districts have a high sex ratio of more than 100. Of the top ten, only Morang, Nawalparasi and Jhapa reported a sex ratio of 98, 96 and 98, respectively, see TABLE 16.10.

It is also observed that the average household size is on the high side except the following: Morang (4.9) and Jhapa (4.6), Dhanusha (5.7) and Siraha (5.7). All the rest are above the national average of 5.7 persons per household.

It is further observed that districts with the most number of agricultural holdings were found in Tarai belt with the district of Morang reporting the most number of 115,162 holdings followed by Jhapa with 104,654 holdings. The two districts with the least number of holdings and less than 50,000 in 2001/02 were the districts of

Bardiya (47,520 holdings) and Banke (49,375 holdings).

Among the districts in Mountain belt, Sindhupalchok reported the most number of farm population of 282,329 comprising 18% of the total farm population in the belt. It also reported the highest number of holdings with 57,360, which is almost the same number of holdings reported in the district of Kapilvastu in Tarai belt. The least populated district in 2001 was the district of Manang with a population of 8,062 persons. Furthermore, the second district that reported the most number of holdings in Mountain belt was Dolakha with 40,396 holdings. Take note that the number of holdings is much lower than the district with the lowest number of holdings in Tarai (Bardiya). In other words, the number of holdings in the different districts of Mountain belt except Sundhupalchok is lower than the lowest number of holdings in Tarai belt districts.

In the Mountain belt, the district of Darchula reported the highest average household size at 6 and the district of Mustang reported the least, 4.4 persons per household, see TABLE 16.9.

TABLE 16.1: AGE AND SEX COMPOSITION OF FARM POPULATION, NEPAL, 2001

Age group	(In thousand except percent)					
	Sex

CHAPTER 17 FARM LABOUR

Of the total farm population of 19,032.5 thousand persons, there were 13,953.0 thousand (73.3%) economically active work force aged 10 years old and above in 2001/02. The labour force participation rate was 70.8 and 71.4 percent in 1991/92 and 2001/02 for the farm population respectively. The participation rate did not change much during the ten years period. About 28.6 percent of the farm population was economically not active in 2001/02. Of the 3,337.4 thousand holdings in Nepal in 2001/02, about 33.8 percent holdings employed agricultural workers which were slightly lower than 35.6 percent in 1991/92.

In 2001/02 the percentage of holdings hiring permanent agricultural workers had gone down compared to that of 1991/92. There

were 1.4 percent of holdings hiring permanent agricultural workers in 1991/92. Such holdings declined to only 0.7 percent in 2001/2.

Percentage of holdings employing occasional workers increased only slightly over the decade, 1991/92 to 2001/02. The percentage of holdings employing occasional workers were 31.1 percent and 30.3 percent in 2001/02 and 1991/92 respectively. Holdings employing both occasional and permanent workers were more in 1991/92 with 3.9 percent of the total holdings while it was only 2 percent in 2001/02. About 66.2 percent of the holdings did not hire any agricultural workers on their holdings in 2001/02.

Table 17.0 Summary Statistics

Description	1991/92 numbers (‘000)	2001/02 numbers (‘000)
A. Total farm population 10 years old & above	11,843.5	13,954.0
- Economically active population	8,379.6	9,968.3
- % of total farm population	70.8	71.4
- Not economically active population	3,463.9	3,985.7
- % of total farm population	29.2	28.6
B. Agriculture workers (%)	100	100
b1 Holdings employing permanent agricultural works only	1.4	0.7
b2 Holding employment both permanent and occasional workers	3.9	2.0
b3 Employing occasional workers only	30.3	31.1
b4 No workers employed	64.2	66.2

17.1 Usual activity of farm population

Farm population as defined earlier consisted of members of the household of the agricultural holder. Some of the data that are presented in this chapter about the usual activity of the farm population came from the Population Census 2001.

The census inquired about the usual activity status of each person that included both economic and non-economic activities. The usual activity of the person refers to what an individual was doing most of the time during the past twelve months whether working in agriculture/own farm, salary/wage work, working in own economic enterprise, doing extended economic activity, doing household chores, going to school or no work at all. Based on the usual activity of the individual, he or she was classified whether economically active or not.

Economically active farm population refers to members of the household of agricultural holdings who are at least 10 years old engaged in any economic activity during the last twelve months or seeking work at any time during the reference period. On the other hand, ‘not economically active farm population’ refers to members of the household of the agricultural holding who are at least 10 years old who have no economic activity. Economic activity refers to the production of goods and services as defined in the system of national accounts.

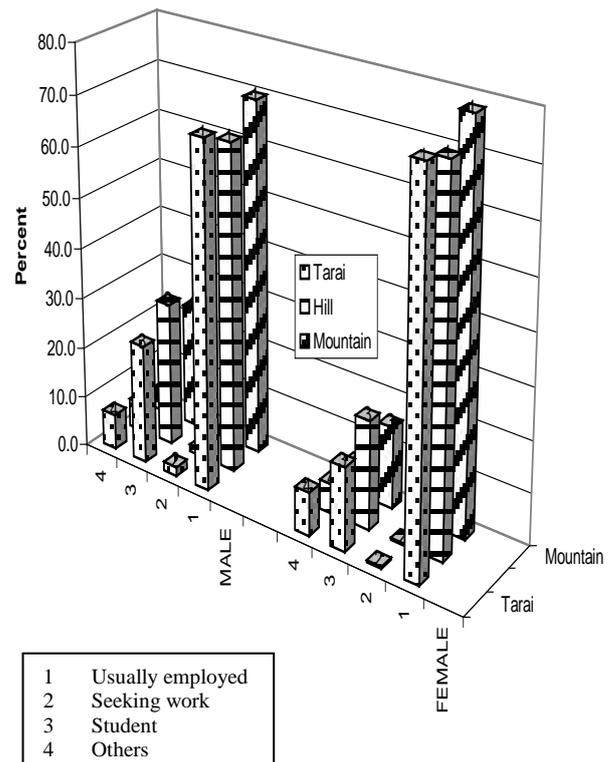

Of the total farm population of 19,032 million people, the potential work force aged 10 years old and over consisted of 13.954 million persons or 73.3% of the total farm population in 2001. Females outnumbered the males with a population of 7.14 million or 51.2% of the total.

The economically active population comprised 71.4% of the total, about 10 million persons of whom 9.84 million were

usually employed during the past twelve months and 128,400 were seeking work.

The ‘not economically active’ population numbered almost 4 million persons and a

FIGURE 17.1: USUAL ACTIVITY OF FARM POPULATION, NEPAL, 2001

little more than 3 million were students while the rest, were either doing household chores or doing nothing.

The females registered a higher proportion of being economically active at 74.6% compared with only 68.1% among males. It is significant to note that there were more females than males who were usually employed during the past twelve months, see TABLE 17.1

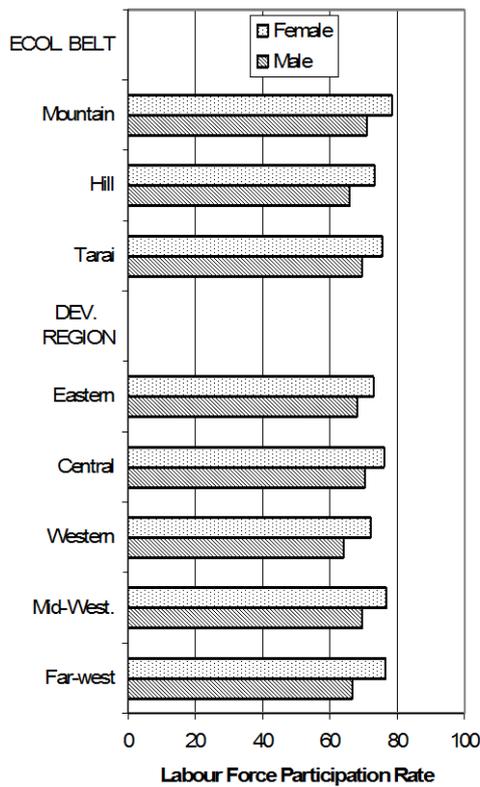

The three ecological belts exhibited the same pattern as the national trend where the females had higher proportion of being economically active than the males. Among the three, Mountain belts reported the highest percentage of females being economically active at 78.4% compared

with Tarai and Hill belts with 75.5% and 73.2%, respectively. Also among the males, Mountain belt reported the highest with 71% economically active followed by Tarai belt with 69.6%. Hill belt reported the lowest, at 65.9%.

17.2 Labour force status of farm population

Based on the labour force concept, the labour force status is classified as either “in the labor force” or “not in the labour force.” “In the labor force” consists of the employed and the unemployed. To

FIGURE 17.2: LABOUR FORCE PARTICIPATION RATE BY GEOGRAPHIC AREA, NEPAL 2001

measure the extent of participation of the population in economic activity, the labour force participation rate is computed, which is the ratio of those in the labour force to the total population 10 years old and over, multiplied by 100 to express it in percent. Those “in the labour force,” that consisted of the employed and the unemployed is conceptually the same as the economically

active population under the gainful occupation concept.

In 2001, labour force participation rate was 71.4 % for the farm population at least 10 years old. The female farm population had a higher participation rate in 2001/02 of 74.6%, compared with 68.1% for the males, a difference of 6.5 percentage points.

By ecological belt, the farm population of the Mountain belt registered the highest participation rate of 74.8% compared with Tarai belt with 72.5% participation rate and Hill belt with 69.7%. The participation rate of the female farm population in each of the three belts was much higher than participation rate of the male farm population, see TABLE 17.2.

17.3 Employment and unemployment rates

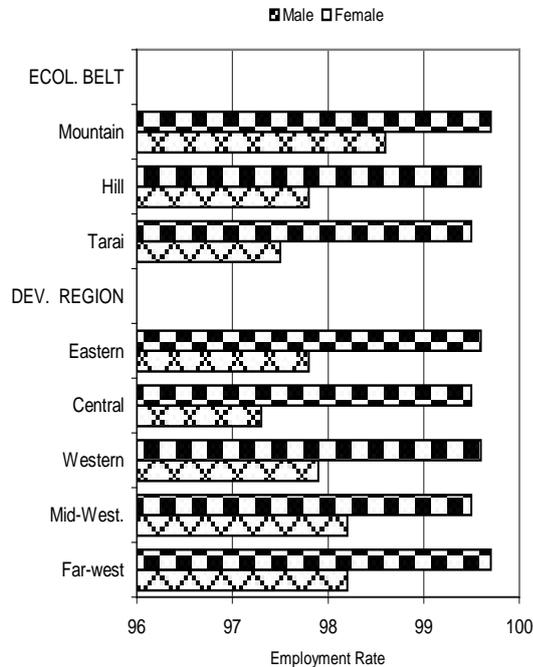

The employment rate is the proportion of the total employed persons to the total population in the labour force multiplied by 100 to translate the proportion to percent. In like manner, the unemployment rate is the proportion of the total unemployed persons to the total population in the labour force, multiplied also by 100 to translate it percent.

In 2001, the employment rate was rather high at 98.7%, therefore, the unemployment rate was 1.3%, which is considered low. The males had lower employment rate than the females but still considered high at 97.7% and the unemployment rate was 2.3%. The female employment rate was 99.6%, therefore the unemployment rate was less than 1%. This simply means that when the female decides to join the labour force, she is more likely to get a job than her male counterpart.

Among the belts, Mountain belt had the highest employment rate of 99.2% followed by Hill belt with 98.8%. Tarai belt yielded the lowest employment rate of 98.6%. In

the three belts, the females registered higher employment rate at 99.7%, 99.6%

FIGURE 17.3: EMPLOYMENT RATE OF FARM POPULATION BY GEOGRAPHIC AREA, 2001

and 99.5% for Mountain, Hill and Tarai belts, respectively. Among the males, Mountain belt had the highest employment rate of 98.6% followed by Hill belt at 97.8% and Tarai belt, 97.5%.

There is not much difference on the level of employment rate among the female farm population in the five development regions, which are all more than 99%. The employment rate of the male population is almost of the same level at about 97% to 98% for the five development regions, see TABLE 17.4.

17.4 Employment of agricultural workers

Of the 3.364 million holdings in Nepal in 2001/02, about 33.8% or 1.138 million holdings did employ agricultural workers. In 1991/92, of the total holdings of 2.736 million, 35.6% or 975,200 holdings had employed agricultural workers. Take note that while the percentage of holdings that hired an agricultural worker in 1991/92 was

higher, the number was 16.7% more in 2001/02.

Two classes of workers were usually hired by the holdings, namely: permanent agricultural workers and occasional agricultural workers. Most holdings hired agricultural workers only occasionally, some hired permanent agricultural workers only and some holdings hired both permanent and occasional workers.

Permanent agricultural workers are workers employed permanently by the holding during the reference year. By permanent is meant that the person worked regularly and continuously on the holding for at least six months during the reference year. In mountain areas, a permanent worker was anyone considered permanent by the holder. Permanent workers excluded any members of the holder's household even if the person is unrelated and being paid work on the holding.

On the other hand, occasional agricultural workers are workers employed by the holding who are not considered to be permanent. Occasional workers include only those who work for payment in cash or in goods. Work done in exchange for labour was excluded.

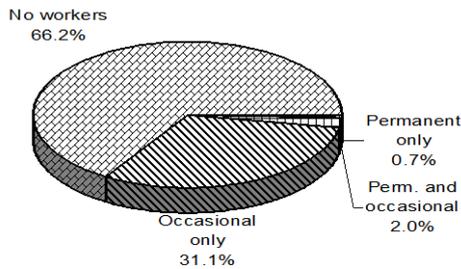

In 2001/02, only 23,200 holdings hired permanent agricultural workers. This number represents only 0.7% of the total holdings.

In 1991/92, the proportion of holdings that employed permanent agricultural workers was 1.4%. There was, therefore, a decrease in the number of holdings that employed permanent workers in their holding in 2001/02.

The employment of occasional agricultural workers in 2001/02 reached more than a million holdings, which was 31.1% of the total compared with 830,200 holdings or 30.3% of the total in 1991/92. Holdings

employing both permanent and occasional workers were more in 1991/92 with 106,200 or 3.9% of the total holdings while

FIGURE 17.4: EMPLOYMENT OF PAID LABOUR, NEPAL, 2001/02, PERCENT OF HOLDINGS

in 2001/02, there were only 68,900 holdings or 2% only of the total, see TABLE 17.5.

17.5 Paid workers at sub-national level

Among ecological belts, Tarai belt reported the highest proportion of holdings employing agricultural workers relative to the total at 40.2%. In the hill belt, the proportion of holdings that employed agricultural workers was 29.6% while Mountain belt reported 25.3% of the holdings employing workers. Furthermore, Tarai belt also reported the highest proportion of employing occasional agricultural workers at 35.8%, which is even higher than that in 1991/92, which was only 34.1%. The Hill belt reported 28.1% and Mountain belt, 23.7%. In terms of the hiring of permanent agricultural workers, Tarai and Hill belts reported the same percentage of 0.7% while Mountain belt reported a slightly lower percentage of 0.6%, see TABLE 17.5.

Among development regions, Central region reported the highest proportion of the number of holdings employing agricultural workers with 44.1% and Far-Western region reported the least, 13.8%, see TABLE 17.6.

In 1991/92, the same trend as observed in 2001/02, i.e. Central region reported 45% of the holding as employing agricultural workers and Far-Western region, reported the lowest with 18.5%. The proportions obtained in 1991/92 were higher than in 2001/02. It does not mean, however, that the actual number is much less in 2001/02.

17.6 Paid workers by size of holding

By size of holding, the large holdings reported the highest proportion of employing agricultural workers at 64% while the small holdings reported only 22.8% of the holdings that employed agricultural workers in 2001/02. Holdings with no land reported the lowest with 5.2%. In 1991/92, the large holdings reported a much higher proportion and the number of large holding employing agricultural workers actually decreased in 2001/02 from 92,700 holdings in 1991/92 to 91,600 holdings in 2001/02, a decrease of 1.2%. On the other hand, there was an increase in the proportion of holdings that employed agricultural workers among the small holdings, percentage-wise and in actual number of holdings, from 21.6% or 913,700 holdings in 1991/92 to 22.8% or 1,218,400 holdings. The increase in the number of holdings employing workers among small holdings was 33.3%, see TABLE 17.7.

17.7 Number of permanent agricultural workers

In 1991/92, there were 301,700 permanent agricultural workers hired by holdings. Of this number, 23.7% were females. At the national level, the sex ratio was 323, i.e. for every 100 females hired, there were 323 males that were employed.

In 2001/02, the number of permanent agricultural workers employed reduced in number to 179,000 persons. There was a decrease of about 40.7% in the number of permanent workers. The sex ratio

increased to 345 males for every 100 female workers.

Of the 179,000 permanent agricultural workers in 2001/02, 125,600 workers or 70.2% were employed in Tarai belt while 41,800 workers or 23.4% were employed in Hill belt, and the rest, (11,600 workers) were in Mountain belt. The Hill belt reported the highest proportion of female workers at 32.8% of the total. The sex ratio was 204 male workers for every 100 female workers. The lowest proportion of female workers was observed in Tarai belt with 18.7%. This trend was also observed in 1991/92.

Among development regions, 70,000 permanent agricultural workers were found in Central region, which consisted of 39% of the total permanent agricultural workers. Other development regions have the following number of permanent workers: Eastern region, 60,400 workers or 33.7%; Mid-Western region, 25,400 workers or 14.2%; Western region, 14,700 workers or 8.2%, and Far-Western region, 8,500 workers or 4.7%.

Mid-Western region exhibited the highest percentage of female permanent agricultural workers with 37.2% and the lowest sex ratio of 169 male workers per 100 female workers.

The lowest proportion of female permanent agricultural workers was in Central region with 19.2% with the highest sex ratio of 420 males for every 100 females.

In 1991/92, Central region employed 101,400 permanent agricultural workers but this number decreased to only 70,000 in 2001/02, a reduction of about 31% in the number of permanent workers. There was also a decrease in Eastern region by about 9,700 between 1991/92 and 2001/02 and the biggest decreases were observed in Mid-Far-Western region by 38,800 workers and Western region by 34,800 workers.

In 1991/92, there were 47,300 permanent agricultural workers in Far-Western region. This number reduced to 8,500 workers only in 2001/02, a decrease of about 82% from 1991/92 figure.

*Rates:

*Labour force participation rate (LFPR) = (farm population in the labour force/ total farm population, 10 years old over) x 100

**Employment rate (ER) = (Total employed /Total population in the labour force) x 100.

***Unemployment rate (UR) =(Total unemployed/Total population in the labour force) x 100

TABLE 17.7: NUMBER AND PERCENT OF HOLDINGS BY EMPLOYMENT OF AGRICULTURAL WORKERS AND SIZE OF HOLDING, NEPAL, 1991/91 AND 2001/02

Employment of workers	Size of holding				
	No land	< 0.5 ha	0.5 - 2.0 ha	2 ha & over	Total
Number of households ('000)					
1991/92					
Employ permanent workers only	0.4	9.4	16.5	12.4	38.8
Employ both perm. and occasional workers	...	8.7	38.5	59.0	106.2
