

# **CHAPTER III**

## **SOCIO-ECONOMIC CHARACTERISTICS OF THE POPULATION IN AGRICULTURAL HOUSEHOLDS**

### **1 INTRODUCTION**

Population as a producer and consumer is closely related with agriculture. On the one hand, population affects production in general and agricultural outputs in particular by furnishing the required labour. On the other hand, the size of a population and its anticipated growth is the main factor determining food consumption requirements. Regarding the balance between population and consumption, if more people are to be fed than the food or services produced, saving and capital investments will be negatively affected. Moreover, population growth also negatively influences agriculture by putting pressure on the environment, such as water, fertility of land, ... etc. Population size further influence productivity mainly through the diversification and specialization of the economy, the size of the market, and the importance of foreign trade.

Not only the size, but also the socio-economic characteristics of the population of the agricultural households is important to the agricultural production. Study of the nature of the agricultural sector of a country will not be complete without proper understanding of the socio-economic characteristics of the population engaged in it. The population statistics of the agricultural households can be used to describe the characteristics and distribution of the population in space, its density and degree of concentration, the fluctuation in its rate of growth and the movement from one area to another. Data on population and agriculture will also help in finding out what percentage of resources will be needed at a particular time for the meeting of basic needs of the people and what amount of socially useful and productive labour is available in the country, regardless of whether labour or capital intensive techniques will suit the nation's economy.

Generally, an analysis of statistical data on population residing in agricultural households is important to assess the size, structure and characteristics of the human resources involved in and supported by the sector. Such kind of information will provide the human background for planners and policy makers in their attempt to formulate policies that helps improve the sector's output as well as the living conditions of the rural population.

Cognizant of this fact, the 2001/2002 Ethiopian Agricultural Sample Enumeration has collected basic social and economic characteristics of the population in agricultural households in October 2001. This chapter assesses the resulting data related to the size, the structure and distribution of the population in agricultural households with some selected variables. These variables include size and age-sex structure, household size, relationship to the head of the household, marital status, literacy, educational level, working status, reason for not working, type of occupation, and employment status. Moreover, this chapter presents statistical tables that show the results at zonal and wereda levels. In the Annex to this chapter are also given tables showing Estimates, Standard Errors (S.E.) and Coefficient of Variation (C.V.) for some relevant variables.

## **2 SIZE AND AGE-SEX STRUCTURE OF THE POPULATION IN AGRICULTURAL HOUSEHOLDS**

In this section, the size and age-sex composition of the population in agricultural households of Amhara Region will be assessed. The population in agricultural households comprises all the persons residing in households with at least one agricultural holder, where a holder is defined as a person who exercises management and control over the operation of the agricultural holding such as land and livestock and makes the major decision regarding the utilization of the available resources (detailed explanation of holder and holdings are provided in Chapter II of this report in the section that deals with concepts and definitions). Whenever is appropriate the assessment will be done separately for non-holders, holders and type of holding.

### **2.1 Size of the Population in Agricultural Households**

Summary Table III.1 presents the estimated population size of the agricultural households in Amhara Region classified by sex, place of residence and holding status. According to the result of this sample enumeration, the population in agricultural households of the region is estimated to be 14,726,570. Of the total population in agricultural households, 14,382,773 are residing in rural areas and the remaining 343,797 that is, only 2.3 percent of the population in agricultural households are residing in urban areas.

The enumeration results show that there were 3,255,768 agricultural holders in the region, making up 22.1 percent of the total population residing in agricultural households. Further

breakdown of the agricultural holders by type of holding is presented in Summary Table III.2. Accordingly, holders practicing crop and livestock farms constitute the largest proportion (73.2%) of total holders. Holders practicing crop only farms make up 19% while those practicing livestock only are about 8% of total holders.

**Summary Table III.1 Size of the Population in Agricultural Households by Sex and Place of Residence**

Place of Residence/ Sex	Total Population in Agricultural Households		Holders		Members Other Than Holders	
	No.	%	No.	%	No.	%
Rural + Urban						
Both Sexes	14,726,570	100.0	3,255,767	22.1	11,470,803	77.9
Male	7,532,648	100.0	2,677,590	35.5	4,855,058	64.5
Female	7,193,922	100.0	578,177	8.0	6,615,745	92.0
Rural						
Both Sexes	14,382,773	100.0	3,183,823	22.1	11,198,950	77.9
Male	7,367,127	100.0	2,625,133	35.6	4,741,994	64.4
Female	7,015,646	100.0	558,690	8.0	6,456,956	92.0
Urban						
Both Sexes	343,797	100.0	71,944	20.9	271,853	79.1
Male	165,521	100.0	52,457	31.7	113,064	68.3
Female	178,275	100.0	19,487	10.9	158,789	89.1

**Summary Table III.2 Size of Agricultural Holders by Sex, Type of Holding and Place of Residence**

Place of Residence/ Sex	Total Holders		Crop Only		Livestock Only		Crop and Livestock	
	No.	%	No.	%	No.	%	No.	%
Rural + Urban								
Both Sexes	3,255,767	100	622,919	19.1	249,425	7.7	2,383,422	73.2
Male	2,677,590	100	424,084	15.8	145,962	5.5	2,107,544	78.7
Female	578,177	100	198,836	34.4	103,463	17.9	275,878	47.7
Rural								
Both Sexes	3,183,823	100	614,471	19.3	210,120	6.6	2,359,232	74.1
Male	2,625,133	100	418,420	15.9	119,194	4.5	2,087,519	79.5
Female	558,690	100	196,050	35.1	90,926	16.3	271,713	48.6
Urban								
Both Sexes	71,944	100	8,449	11.7	39,305	54.6	24,190	33.6
Male	52,457	100	5,663	10.8	26,768	51	20,026	38.2
Female	19,487	100	2,785	14.3	12,537	64.3	4,164	21.4

The enumeration result further shows that the proportion of holders among the males to be significantly higher than their female counterparts. In the rural and the urban areas, the proportion of the holders among the males is about five times and three times higher than that of the females, respectively.

Regarding distribution of the population in agricultural households of zones by type of holding, the enumeration result presented in Summary Table III.3 shows that in all zones, except Bahir Dar, combination of crop and live stock is the dominant type of holdings where

the proportion who combine crop and live stock is highest (78.6 percent) for South Wollo and least (33.8 percent) for Bahir Dar Zone. The majority of the population in agricultural house holds of Bahir Dar zone hold livestock only. On the other hand, exclusive crop farming is more common (22.4 percent) in East Gojam zone and least common (4.8 percent) in Bahir Dar Zone.

**Summary Table III.3 Distribution of Population in Agricultural Households by Holding Status, Type of Holding, Zone and Place of Residence**

Zones	Place of Residence	Total Population in Agricultural Households	Total Holders		Holders by Type of Holding		
			No.	%	Crop Only	Livestock Only	Crop and Livestock
Amhara Region	Rural + Urban	14,726,570	3,255,767	100	19.1	7.7	73.2

## **2.2 Age-Sex Structure of the Population in Agricultural Households**

Age and sex are among the important Factors that determine the status of individuals in their community in general and their involvement in production process in particular. The age-sex composition of a population of an area is the product of past fertility, mortality and migration trends. Age and sex structure are important for the functioning of the economy including the agricultural economy, since these two attributes constitute the main criteria for determining entrance into the work force and the division of labour. It is also important for several purposes. Among others, age-sex data is useful for in-depth analysis of socio-economic characteristics of a given population. Also, age-sex data is vital for making component and sectorial projections.

The percentage distribution of the population in agricultural households by sex, age group, place of residence, and holding status and type is presented in Summary Table III.4. Also, the single year age and five years age distribution of the population in agricultural households are presented in Figure III.1 and Figure III.2, respectively. The population in agricultural households in both rural and urban areas is characterized by young age. As the data in the table shows, 53.2% and 50.9% of rural and urban population in agricultural households are under 18 years of age. Those persons aged 60 years and above constitute nearly equal proportion, that is, 5.6 % in rural and 5.9% in urban areas. According to the age pyramid, the age pattern of the region's population in agricultural households appears to be fluctuating (see Figures III.1 to III.3). As can be observed from Figure III.2 the age pyramid began to narrow at the base (0-4 years) and this is possibly due to decline of fertility. The chance of being holder becomes significant after age 25 and gets its peak at age 30-39 for males at age 60 and above among females (see Figure III.3)

The age pattern observed at regional level among total holders also holds true for both crop only holders and crop and livestock holders, with less than 6% of the young under age 25 years practicing crop and livestock agriculture. In the case of persons who are engaged in livestock only, however, the involvement of the young population who are under age 25 years is very significant (40.4%) probably due to shortage of land. This phenomenon of a significant proportion of the young being livestock only holders is particularly true in rural areas.

**Fig. III.1 Distribution of Population in Agricultural Households by Sex and age in single year (urban + rural)**

**Fig III.2 Age-Sex Distribution of Population in Agricultural Households (urban + rural)**

**Fig III.3 Age-Sex Distribution of Population of Agricultural Holders (urban + rural)**

The sex distribution of a population can be studied using indices called "sex ratios" that are calculated as a ratio of males per 100 females. When the ratio is over 100, the males are in excess and when less than 100 the females predominate. The sex ratio of the population in agricultural households by holding status and type of holding are calculated and presented at the bottom of Summary Table III.4. In a population where there is no sex selective migration, the overall sex ratio is expected to be around 100. In addition, sex ratio for the population in agricultural households will be affected by movements of people between agricultural and non-agricultural households within the region itself. For the population in agricultural households of Amhara Region, the overall sex ratio is found to be 104.7, showing slight excess of males over females. The situation in urban areas where the result shows a sex ratio of 92.8 is, however, different from that of the rural areas indicating that there are more females than males in urban areas.

The table further shows a sex ratio of 463.1 for agricultural holders. That is, for every 100 female holders there are 463 male holders. The excess of male holders over females is extremely large among those practicing both crop and livestock holding. The pattern observed at regional level appears true in both urban and rural areas with urban holders showing relatively lower sex ratios for crop and livestock and crop only holders and higher sex ratio for those practicing livestock only.

## **2.3 Household Size**

Size of household refers to the entire number of persons- related or unrelated who comprise one private household. In this survey a household is defined as either single person who makes provisions for his own or a group of two or more persons who live together and make common provisions for food and other essentials of living.

Summary Table III.5 presents the distribution of the agricultural households by number of persons per household and average household size for male and female-headed households.

According to the sample enumeration, on September 2001 there were 3,064,115 agricultural households in Amhara Region. These households altogether accommodates 14,726,570 persons, resulting in average household size of 4.8 persons per agricultural household. Regarding the distribution of persons per household, the data in the table shows that, the majority of households have 4-5 persons (34.8 percent) closely followed by those with 6-9 persons (33.6 percent) and 2-3 persons (26.4 percent). Single person households and households with 10 and more persons each comprise about 3 percent and 2 percent, respectively.

**Summary Table III.5 Distribution of Agricultural Households by Household Size, Sex of Head, and Place of Residence**

Rural/ Urban and Sex of Head	Total Population in Agricultural HHs	Total Households		Household Sizes					Average Household Size
		Nº	%	One Member Household	2-3 Members Household	4-5 Members Household	6-9 Members Household	10 & above Members Household	
Rural + Urban									
Total	14,726,570	3,064,115	100	3.4	26.4	34.8	33.6	1.8	4.8
Male Head	13,063,293	2,558,148	100	1.4	22.1	36.1	38.2	2.1	5.1
Female Head	1,663,277	505,967	100	13.2	47.6	28.4	10.6	0.2	3.3
Rural									
Total	14,382,773	2,993,947	100	3.4	26.4	34.9	33.6	1.8	4.8
Male Head	12,787,720	2,506,565	100	1.4	22.2	36.1	38.1	2.1	5.1
Female Head	1,595,053	487,382	100	13.3	47.8	28.3	10.4	0.2	3.3
Urban									
Total	343,797	70,168	100	3.9	25.9	33.4	33.7	3.2	4.9
Male Head	275,573	51,583	100	1.9	19.6	33.8	40.6	4.1	5.3
Female Head	68,224	18,585	100	9.2	43.3	32.1	14.5	0.9	3.7

Average household size for agricultural households in urban areas is slightly higher than that in rural areas. The enumeration results further show that the size of households differs by the sex of head. In both rural and urban areas, male-headed agricultural households appear to have larger household size, with the difference more pronounced in rural areas. As can be observed in Summary Table III.5, on average, male-headed agricultural households in both rural and urban areas of the region have about 2 more persons. In rural and urban areas, about 13 percent

and 9.2 percent of female-headed agricultural households are occupied by women living alone, respectively.

As presented in Summary Table III.6 Bahir Dar, North Gondar and Awi zones have relatively higher average household size, on the other hand Wag Hamera and North Wolo zones have relatively lower average household size than the other zones (4.5). Similar pattern holds true in rural areas. In urban areas, Bahir Dar and Awi Zones registered the highest average household size.

### **3 SOCIO-ECONOMIC CHARACTERISTICS OF THE POPULATION IN AGRICULTURAL HOUSEHOLDS**

In addition the 2001/2002 Ethiopian Agricultural Sample Enumeration has collected some basic social and economic characteristics of the population residing in agricultural households. The information collected included relationship to the head of the household, marital status, literacy

status and educational level, work status, employment status and type of occupation. In this respect, this section of the chapter presents some of the major findings of the sample census.

### **3.1 Relationship With The Head of Household**

Relationship to the head of the household is an important measure of household formation and hence it is a pivot on which modern method of projecting households and families turns. Relationship to the head of the household is considered in this report for its influence on agricultural holding status and certain decision to be taken related to agricultural activities. In the sample census the head of a household is any member of the household who is recognized as a head by the other members.

Summary Table III.7 presents the distribution of the population in agricultural households by sex, relationship to the head of the household, holding status and type of holdings for Amhara Region. Among both the males and the females the majority of the population in agricultural households is children of heads (53.6 percent). Next to children of heads are the heads (20.8 percent) and the spouses (16.7 percent). The proportion of heads among the males is substantially higher than that of the females, reflecting the fact that males in most societies assume execution of the major roles of the agricultural activities and the head is considered as the main bread winner in the household as well as the one who merely bear responsibility.

The overwhelming majority of both male and female holders (95.3 percent, and 85.7 percent, respectively) are heads of households and this dominancy of heads of households is highly pronounced in the crop and livestock, and crop only holdings. Children and spouses have substantial contribution among livestock only holders (35.4 percent, and 7.1 percent, respectively) and this phenomenon is more pronounced in the rural areas than urban areas.

### **3.2 Marital Status**

This section presents the level and pattern of marital status of the population in the agricultural households in Amhara Region. In addition to being one of the important proximate determinants of fertility, marriage has economic and social implications. Generally, marriage is basic to family formation. In countries like Ethiopia, where the agriculture is subsistence farming, families play central role in the production processes, income maintenance, economic status, ...etc.

In the census questionnaire, information was collected on the marital status of the population 10 years of age and older. The marital status was categorized into four main groups, namely never married (single), married, divorced and widowed. A person who had never been married is considered to be single, whereas married persons include, couples who are living together bonded by any kind of marital engagement at the time of the census (traditional, religious or civil marriage). Separated couples are also considered to be married, unless they had dissolved their marriage agreement legally, a person who had been married but whose marriage was dissolved through divorce before the census day is categorized as divorced, and a person whose marriage was dissolved through the death of the spouse is categorized as widowed.

Summary Table III.8 presents the distribution of the population in agricultural households by marital status and broad age group. As the data in the table indicates, little above half of the population in the agricultural households in the region is in marital union at the time of the enumeration. Those who never married constitute about 33.4 percent while 12.0 percent have dissolved their marriage due to divorce or the death of the spouse. The data further show that a higher proportion of the males to be in single-hood status while the incidence of dissolution of marriage is significantly higher among the females than the males. Regarding the marital status of the agricultural holders in the region, the data in the table shows that, the majority (77.7 percent) were in marital union at the time of the census.

About 72.9 percent and 38 percent of the young (aged 10-17 years) female population in agricultural households, and the holders, respectively are single, indicating early start of marriage in the region's female population, particularly among holders. Further, marriage is universal in the region as evidenced by the fact that at age 50 and over the proportion of single is only about one percent for each of the males and the females.

### **3.3 Level of Education of the Population in Agricultural Households**

Education is another important social characteristic that affects the well-being of individuals or societies in general. Level of education is associated with the participation as well as the productivity of agriculture. Education improves knowledge and use of agricultural practices and applied technology in agricultural operations. Therefore, compiling and analyzing data on the educational attainment of the population in the agricultural households is essential for development planning.

The 2001/02 Agriculture Sample Enumeration of Ethiopia provides two types of data regarding education, namely, literacy status and educational attainment of persons aged 10 years or more. In the census a person is considered as literate if he/she can read and write simple sentence in any language. Educational attainment was obtained by asking individuals who can read and write concerning the highest grade completed and response were classified as non formal education and grades completed in the formal school system. Formal education /regular school/ is used to describe the educational system that provides a ladder by which individuals may progress from primary school through universities. On the other hand, the non-formal education that are entertained in this census includes those persons that were not in the formal schools such as self directed, or religious/socially directed learning or teachings to read and write, with any of the languages.

The population in the agricultural households aged 10 years and over in Amhara Region classified by sex, literacy status and level of education, holding status and type of holding and place of residence is presented in Summary Table III. 9. The level of education in this table is classified as: primary level education which include grades 1-6, and above primary level education

The data in the table reveals that 29.3 percent of the population in the agricultural households of Amhara Region to be literate. The literacy level among the urban dwellers (67.0 percent) is

about two times higher than that of rural areas (28.3 percent). The census result also shows that, relatively, more males than females to be literate in both rural and urban areas. For instance, in rural areas 38.0 percent of males against 17.9 percent of females were literate.

About 10.8 percent and 8.5 percent, respectively, of the rural and the urban population aged 10 years and over in agricultural household were able to read and write through non formal education. Those who attained primary level education make up 15.7 percent and 33.6 percent of the population in agricultural households of the rural and urban areas, respectively. On the other hand, very small proportion (only 1.8 percent) of the population in the rural areas of agricultural households and a relatively higher proportion (24.8 percent) of the population in the urban agricultural households have attained an educational level of above primary school.

The proportion of literates did not show much variation among the agricultural holders and non-holders. On the other hand, those who are crop and livestock holders are slightly better off in terms of level of education than those engaged in crop only and livestock only. The low literacy level among those engaged in livestock only than those engaged in crop and livestock is unexpected in view of the fact that the former are significantly young age.

With respect to the proportion of literates, population in agricultural households of Bahir Dar Zone has relatively the highest level (72.6 percent) probably due to its exclusive urban nature. The advantage of Bahir Dar Zone in this regard is registered for both members other than holders and agricultural holders (See Summary Table III.10). In Semen Shewa, Mirab Gojam, Awi and Bahir Dar zones livestock holders are more literate than the other types of holdings, while those engaged in crop and live stock agriculture are more literate in Bahir Dar Zone.

### **3.4 Work Status of the Population in Agricultural Households**

All persons aged 10 years and over who are members of the agricultural households in both urban and rural areas were asked whether or not they have been engaged in productive activity during most of the 12 months prior to the census date. In the census economic or productive activity was defined in terms of production of goods and services that fall within the United Nations System of National Accounts (SNA) production boundary (ILO, 1990). Hence, in the 2001/2002 Agricultural Sample Enumeration, economic activity or productive activity is defined as a work that involves the production of goods and/or services for sale or exchange and production of certain products for own consumption. According to the above general definition, economic activity covers production of goods and services intended for sale on the market, production of other goods and services such as government activities; production and processing of primary products (agriculture, hunting, fishing, forestry and logging; and mining and quarrying) for own consumption, processing of primary products by the producers themselves, production of other commodities where part of it is sold on the market; and own account construction and fixed asset formation (expected life use of one year or more). Such economic activities could be performed for an individual, family or private enterprise, government establishment or public organization. The remuneration may be on daily, weekly, monthly, yearly or contract basis.

For a person to be counted as working during most of the last 12 months, he/she has to be engaged in any kind of economic activity at least for half of the reference year. In the case of persons engaged in agriculture, it was decided to consider them as being engaged in economic activity during most of the last 12 months if they have worked during most of the main agricultural season of the reference year. The distribution of the population aged 10 years and over in agricultural households of Amhara Region classified by sex, age group and work status is presented in Summary Table III.11. According to the census result, out of the total 9,927,727 persons aged 10 years and over who are members of the agricultural households in the region, 78.7 percent were reported to have engaged in some kind of productive activity during the 12

months prior to the enumeration date. The proportion of working population among the male is relatively higher than that of females, that is, 88.5 percent of the males against 68.2 percent among the females were engaged in productive activity during the 12 months prior to the survey data.

Consistent with previous surveys, engagement in productive activity is higher in the rural areas than the urban areas of the region. In rural areas more than three fourth of the agricultural population was working during most of the 12 months prior to the survey date. Whereas, the working persons in urban areas constituted about 55.6 percent of the population in question. In both rural and urban areas, the proportion working among the males is higher than that of the females with equal range of gender disparity (See Figure III.4).

As can be seen from Figure III.5 engagement in productive activity is highest for persons of middle age (30 -49 years) . As expected, the proportion working is lowest for the children aged 10-17 years. This phenomenon holds true for both the males and the females in rural as well as urban areas. One special feature in urban areas is that the proportion of the working children aged 10-17 years is very low compared to those persons in the upper age groups (See Figure III.5).

**Fig. III.4 Working Population by Sex and Place of Residence**

**Fig. III.5 Proportion Working by Age Group and Place of Residence**

Summary Table III.12 presents the proportion of working population in agricultural households by zone, place of residence and sex. The levels of engagement in productive activity show some variation between zones. In rural areas, the proportion engaged in productive activity ranged from 68.2 percent for North Gonder Zone to 87.6 percent for South Wolo Zone. On the other hand, in urban areas the proportion ranged from 46.8 percent for East Gojam Zone to 64.5 percent for South Wolo Zone. In all the zones males have higher engagement level than females, the gap being wider for rural and urban North Gonder Zone.

### 3.5 Reason for Not Working

The distribution of non-working population in agricultural households by main reason for not working and selected background variables is presented in Summary Table III.13. In both the rural and the urban areas of the region, the two most important reasons for not working are attending school or being a student and home making, together constituting 80.3 percent (34.4% + 45.9%). Disability or illness, and old age have very little contribution. The patterns, in the

urban and the rural areas are similar home makers constituting the majority of non-working population in rural areas while students dominating in urban areas.

The distribution of reasons for not working among the male population is different from that of the females. Students make up the overwhelming majority (68.7 percent) among non-working males while homemaking is the major (60.8 percent) reason for not working among the females.

The pattern of reason for not working varies as age increases. As expected, students make up the majority (64 percent) of non working population aged 10-17 years, while students and homemakers are important reasons among those aged 18-29 years, contributing 24.5 percent and 64.2 percent, respectively. On the other hand, homemakers constitute the majority (82.8 percent) of non-working population aged 30-49 years, while old age/pension is the major reason for not working among those aged 50 years and above.

### **3.6 Type of Occupation for Working Population**

Data on type of occupation was collected for all persons who have reported to have been engaged in productive activity during most of the last 12 months. The response to the question is classified as fully agricultural, partially agricultural and non-agricultural. This information provides the extent to which the agricultural population is engaged in other activities.

Summary Table III.14 presents the distribution of the population in the agricultural households age 10 years and over who are engaged in productive activity by type of occupation and background variables. The census result shows that about 85 percent of the population in agricultural households age 10 years and over was engaged in fully agricultural activities, while only about 13.7 percent of the population was engaged in partially agricultural activities. The proportion of population engaged in non-agricultural activities only was negligible, amounting to 1.1 percent. Contrary to the expectations, in urban areas the proportion engaged in fully agricultural activities is larger than those who engaged in partial or non agricultural activities.

Similar pattern of type of occupation was observed among the males and the females. Also there is little variation by age in the type of occupation. All the zones except Bahir Dar Zone

have similar distribution of type of occupation for the population in agricultural households. Bahir Dar Zone depicted substantially higher proportion of non-agricultural population.

**Summary Table III.13 Non Working Population in Agricultural Households by Reason for Not Working and Some Background Variables**

### 3.7 Employment Status of Population Engaged in Agricultural Activities

Employment status of working population indicates the level of involvement and degree of decision-making in the respective activities. In this sample enumeration persons engaged in fully or partially agricultural activities were asked to report the employment status in that activity.

**Summary Table III.14 Percentage Distribution of Population in Agricultural Households Engaged in Productive Activity by Type of Occupation and Some Background Variables**

Oromiya	174,139	100	78.7	19.8	1.5
Bahir Dar	9,715	100	45.3	29.6	25.1

According to the data presented in Summary Table III.15, unpaid family workers constituted the highest proportion (57.4 percent) of the population in agricultural households who are engaged in agricultural activities. About 34.7 percent of the working population were own account workers working in their farms alone or with the help of family members but with out hiring labor. The proportion who hires others in their farm is only 4 percent, showing the low capacity of the region's agricultural industry to create employment opportunity for non holders. On the other hand, only 3.9 percent of the population in agricultural households engaged in agricultural activities were employees.

**Summary Table III.15 Percentage Distribution of Population in Agricultural Households

The situations in urban and rural areas are different, where the tendency to work for the family without payment is less common in urban areas. Also, being employer is relatively higher in the urban areas than the rural areas. The overwhelming majority (84 percent) of female respondents in agricultural households who are engaged in agricultural activities are unpaid family workers while self-employment (own account) is relatively the common type of employment status (49.8 percent) among males, showing the dominance of males over females in the tradition/culture of the society. As in the case of other variables, the distribution by employment status of the population in agricultural households did not show noticeable variation among the zones, with exception of Bahir Dar Zone.
