Ranking of Communities

- “...many assets play a both direct and indirect effect on outcomes [...], there is no way to infer from the unconstrained coefficients on the asset variables from a multivariate regression analysis the impact of an increase in wealth” (Filmer and Pritchett, 1998).

Ranking of Communities

- An “asset index” by Filmer and Pritchett (1998), has found found significant support in the research community.
- The Filmer and Pritchett Asset Index, is based on using principal components analysis to derive weights for household assets, which are then used to construct a weighted aggregate index, and consequently, to classify households (or survey populations) into quintiles of “wealth”. . The Filmer and Pritchett Asset Index is named with a variety of terms: the Wealth Index, the Asset Index, the Standard of Living Index, etc.

Ranking of Communities

- Is it worth the effort to use principal components analysis, which probably alienates the less statistically minded researcher or the potential non-technical reader by relying on an abstract set of weights for household assets? Or, is it possible to obtain similar results by using other, simpler approaches?**Which can be better explained**

This is the question which was asked in this article:

PERFORMANCE OF ALTERNATIVE APPROACHES FOR IDENTIFYING THE RELATIVELY POOR AND LINKAGES TO REPRODUCTIVE HEALTH
