# **NATIONAL AGRICULTURAL SURVEY 2008 (NAS 2008)**

Report of national data analysis

“If you don’t count, you don’t count”

February 2010

## **FOREWORD AND ACKNOWLEDGMENT**

The National Institute of Statistics of Rwanda is pleased to present the report of the National Agricultural Survey 2008 (NAS 2008) undertaken on Rwandan territory from September 2007 to August 2008 in collaboration with its partners and stakeholders in the field of Agricultural Statistics.

This report comes at the right point in time since Agriculture accounts for a third of Rwanda's GDP, constitutes the main economic activity for the rural households and remains their main source of income. In 2005/2006, the agricultural population was estimated to be 89.6% of the total population.

Secondly, the objective of The National Agriculture Policy (NAP), formulated by the Ministry of Agriculture and Animal Resources is to contribute in a sustainable manner to poverty reduction through increased and diversified households' incomes, and to support Rwanda's economic growth while ensuring food security for the entire population.

Lastly, the country's economic development and poverty reduction strategy (EDPRS) defines a large number of programs in the agriculture sector, these include; the intensification of sustainable production systems in crop cultivation and animal husbandry; building the technical and organizational capacity of farmers; promoting commodity chains and agribusiness, and strengthening the institutional framework of the sector at central and local level.

To support the decision-making, measure the impact of interventions in the rural sector, and allow the monitoring of the implementation of the NAP and EDPRS programs, the Rwandan Government and its development partners need up-to-date and reliable statistics on the agricultural sector. Along this line, it was necessary to collect information based on a post harvest agriculture survey to assess the current situation of the country with regards to the targets set by poverty reduction programs.

The NAS 2008 results shall therefore be utilized to support the monitoring and evaluation of the agricultural sector's performance regarding the EDPRS and Vision 2020 targets. Vision 2020 sets objectives for the growth rate of the agricultural section at 6% per annum, the agricultural production at 2200 kcal per person per day, an agricultural population of 50% of the total population and the use of fertilizers at 15 Kg per hectare per year. The EDPRS sets an objective of 100% of agricultural land protected against erosion and a proportion of rural households that own livestock at 85% for the 2012 horizon.

Provided that the decentralization policy adopted by the country recognizes the district as the primary planning and development entity, NISR is pleased to present for the first time to decision makers and other users, agricultural statistics that are disaggregated at the district level. The results herein obtained include a wealth of information on the situation observed in the two agricultural seasons of 2008 and will serve as a baseline to fine-tune appropriate strategies to promote the agricultural sector at the district level.

The NISR is highly indebted to the heads of households wherever the data collection was done. This work wouldn't have been a reality without the cooperation of the women and men who devoted their time to answer all the questions.

My profound gratitude goes also to the NISR teams and the consultants who conducted the survey design, field work implementation, data processing and analysis and to local authorities who supported the field work organization.

I would like finally to express my sincere thanks to the DFID, EC, FAO and WFP which provided support and funding for the study.

**YUSUF MURANGWA**

**Acting Director General  
National Institute of Statistics of Rwanda**

## ACRONYMS AND ABBREVIATIONS

1. Cal/per/day: Calories per person and per day.
2. CSPro: Census and Survey Processing System.
3. DFID: Department for International Development
4. EAs: Enumeration Areas.
5. EC : European Community
6. EDPRS: Economic Development and Poverty Reduction Strategy
7. FAO: Food and Agriculture Organization of the United Nations.
8. Fat/per/day: Fats by person and per day.
9. GDP: Gros Domestic Product.
10. Grs: Grammes.
11. Ha: Hectare.
12. Kg: Kilogramme.
13. MDG: Millennium Development Goals
14. Min: Minutes.
15. MINAGRI: Ministry of Agriculture and Animal Resources.
16. NAP: National Agriculture Policy
17. NAS: National Agricultural Survey.
18. NISR: National Institute of Statistics of Rwanda.
19. OCIR: Office des Cultures Industrielles de Rwanda
20. PPS: Probability Proportional to Size.
21. Prot/per/day: Proteins per person and per day.
22. Prov.: Province.
23. PSU: Primary Sampling Unit.
24. RGPH: Recensement Général de la Population et de l'Habitat.
25. RWF: Rwandan Franc (currency).
26. SSU: Secondary Sampling Units.
27. WFP: World Food Program.

# TABLE OF CONTENTS

	<b>Page</b>
Preface.....	i
Acronyms.....	iii
Table of contents.....	iv
List of main and supplementary tables, figures and maps.....	v
<b>Chapter 1 – Executive summary.....</b>	<b>1</b>
<b>Chapter 2 – Introduction.....</b>	<b>5</b>
2.1. Survey framework.....	5
2.2. Justification of the survey.....	6
2.3. Objectives of the survey.....	7
<b>Chapter 3 – Methodology of the survey.....</b>	<b>8</b>
3.1. Introduction.....	8
3.2. Coverage of the survey.....	8
3.3. Sampling.....	9
3.4. Data extrapolation .....	13
3.5. Data collection .....	15
3.6. Data processing.....	16
3.7. Data analysis.....	17
<b>Chapter 4 – Analysis of main survey results.....</b>	<b>20</b>
4.1. Demographic and social characteristics of agricultural householders and population.....	20
4.2. Farm characteristics .....	35
4.3. Agricultural practices and crop production .....	41
4.4. Livestock practices and production .....	57
4.5. Fishery, aquaculture and beekeeping practices and production .....	65
4.6. Forestry practices and income .....	68
4.7. Food stocks and nutrition of agricultural households .....	73
<b>Chapter 5 – Conclusions.....</b>	<b>78</b>
5.1. Which lessons learnt from the implementation of the NAS 2008?.....	78
5.2. Have the objectives of the survey been reached?.....	79
5.3. Which way forward after the NAS 2008?.....	81
<b>Annexes.....</b>	<b>82</b>
- Annex 1. Supplementary/detailed tables of the survey results.....	83
- Annex 2. Survey Questionnaire .....	226
- Annex 3. Bibliography.....	249

## **LIST OF ADDITIONAL TABLES (IN ANNEX)**

### **SOCIO-DEMOGRAPHIC CHARACTERISTICS OF FARMERS**

- A 4.1.1. Agricultural households by province, district and sex of the household head
- A 4.1.2. Average age of agricultural household heads by province, district and sex
- A 4.1.3. Agricultural households according to the main and secondary activity of the household head
- A 4.1.4. Agricultural population by province, district and sex
- A 4.1.5. Agricultural population (%) by province, district and family relationship with the household head
- A 4.1.6. Agricultural population (%) by province, district and age groups
- A 4.1.7. Agricultural population aged 15 years and above, by province, district and literacy level
- A 4.1.8a. Agricultural population aged 6 years and above, by province, district and level of education
- A 4.1.8b. Agricultural population (%) aged 6 years and above, by province, district and level of education
- A 4.1.9a. Agricultural population by province and district according to literacy level, activity age group and sex
- A 4.1.9b. Agricultural population (%) by province and district according to literacy level, activity age group and sex
- A 4.1.10. Mean structure of agricultural population by province and district according to literacy level, activity age group and sex
- A 4.1.11a. Total number of agricultural population according to the main and secondary activity
- A 4.1.11b. Agricultural population (%) according to the main and secondary activity
- A 4.1.12a. Total number of agricultural workforce (aged 15 to 65 years) by province, district, and main activity.
- A 4.1.12b. Agricultural workforce (%) (aged 15 to 65 years) by province, district and main activity.
- A 4.1.13a. Total number of agricultural workforce (aged 15 to 65 years) by province, district and secondary activity
- A 4.1.13b. Total number of agricultural workforce (aged 15 to 65 years) by province, district and secondary activity
- A 4.1.14a. Total number of agricultural workforce aged 6 years and above according to age group, main and secondary activity
- A 4.1.14b. Agricultural workforce (%) aged 6 years and above according to age-group, main and secondary activity

## **CHARACTERISTICS OF AGRICULTURAL HOLDINGS**

- A 4.2.1a. Area (Ha) of agricultural land by province and district and according to the main method used for erosion control
- A 4.2.1b. Agricultural land distribution ( in Ha and %) by province and district and according to the main method used for erosion control
- A 4.2.2.. Proportion (%) of Agricultural holdings by province and district according to the level of splitting , average number of blocks and average size.
- A 4.2.3a. Total number of agricultural households by province and district according to holding size ( area intervals in Ha).
- A 4.2.3b. Proportion (%) of agricultural households by province and district according to holding size ( area intervals in Ha)
- .A 4.2.4. Agricultural land distribution ( in Ha and %) by province and district according to the mode of acquisition
- A 4.2.5. Agricultural land distribution by province, district and according to the main method of water supply to crops
- A 4.2.6. Agricultural land distribution by province, district and according to farming method practiced
- A 4.2.7. Agricultural land distribution by province, district and according to the time used (in minutes) to go to farm block from dwelling
- A 4.2.8. Agricultural land distribution by province, district and according to the topographic location
- A 4 2.9. Agricultural land distribution (in ha) by province, district and by the main purpose of field

## **AGRICULTURAL PRACTICES AND CROP PRODUCTION**

- A 4.3.1a. Agricultural households having used agricultural inputs by province and district during Season 2008A
- A 4.3.1b. Agricultural households having used agricultural inputs by province and district during Season 2008B
- A 4.3.2a1. Agricultural households expenditure (in RWF) on agricultural inputs by province and district during Season 2008A
- A 4.3.2a2. Agricultural households expenditure (in RWF) (%) on agricultural inputs by province and district during Season 2008A
- A 4.3.2b1. Agricultural households expenditure (in RWF) on agricultural inputs by province and district during Season 2008B
- A 4.3.2b2. Agricultural households expenditure (in RWF) (%) on agricultural inputs by province and district during Season 2008B
- A 4.3.2c1. Agricultural households expenditure (in RWF) on agricultural inputs by province and district during the whole agricultural Year 2008

A 4.3.2c2. Agricultural households expenditure (in RWF) (%) on agricultural inputs by province and district during the whole agricultural Year 2008

A 4.3.3a1. Number of households with agricultural inputs purchased by province and district during Season 2008A

A 4.3.3a2. Households (%) with agricultural inputs purchased by province and district during Season 2008A

A 4.3.3b1. Number of households with agricultural inputs purchased by province and district during Season 2008B

A 4.3.3b2. Households (%) with agricultural inputs purchased by province and district during Season 2008B

A 4.3.4a1. Agricultural households expenditure (in RWF) on agricultural equipments by province and district during the Season 2008A

A 4.3.4a2. Agricultural households expenditure (%) on agricultural equipments by province and district during the Season 2008A

A 4.3.4b1. Agricultural households expenditure (in RWF) on agricultural equipments by province and district during Season 2008B

A 4.3.4b2. Agricultural households expenditure (%) on agricultural equipments by province and district during Season 2008B

A 4.3.5a1. Agricultural households expenditure (in RWF) on chemical fertilizers by province and district during Season 2008A

A 4.3.5a2. Agricultural households expenditure (%) on chemical fertilizers by province and district during Season 2008A

A 4.3.5b1. Agricultural households expenditure (in RWF) on chemical fertilizers by province and district during Season 2008B

A 4.3.5b2. Agricultural households expenditure) (%) on chemical fertilizers by province and district during Season 2008B

A 4.3.6a1. Agricultural households expenditure (in RWF) on pesticides by province and district during Season 2008A

A 4.3.6a2. Agricultural households expenditure (%) on pesticides by province and district during Season 2008A

A 4.3.6b1. Agricultural households expenditure (RWF) on pesticides by province and district during Season 2008B

A 4.3.6b2. Agricultural households expenditure (%) on pesticides by province and district during Season 2008B

A 4.3.7a. Crops production (in tons) by Province and District during Season 2008A

A 4.3.7a. Crops production (in tons) by Province and District during Season 2008A

A 4.3.7a. Crops production (in tons) by Province and District during Season 2008A

A 4.3.7a. Crops production (in tons) by Province and District during Season 2008A

A 4.3.7a. Crops production (in tons) by Province and District during Season 2008A

A 4.3.7a. Crops production (in tons) by Province and District during Season 2008A

A 4.3.7b. Crops production (in tons) by Province and District during Season 2008B

A 4.3.7b. Crops production (in tons) by Province and District during Season 2008B

A 4.3.7b. Crops production (in tons) by Province and District during Season 2008B

A 4.3.7b. Crops production (in tons) by Province and District during Season 2008B  
A 4.3.7b. Crops production (in tons) by Province and District during Season 2008B  
A 4.3.7b. Crops production (in tons) by Province and District during Season 2008B  
A 4.3.7c. Annual Crops production (in tons) by Province and District  
  
A 4.3.7c. Annual Crops production (in tons) by Province and District  
A 4.3.7c. Annual Crops production (in tons) by Province and District  
A 4.3.7c. Annual Crops production (in tons) by Province and District  
A 4.3.7c. Annual Crops production (in tons) by Province and District  
A 4.3.7c. Annual Crops production (in tons) by Province and District  
  
A 4.3.8a. Agricultural households by province, district and type of horticulture practiced during Season 2008A  
A 4.3.8b. agricultural households by province, district and type of horticulture practiced during Season 2008B  
  
A 4.3.9a. Households having planted fruits and / or flowers by province, district and main source of plants during Season 2008A  
  
A 4.3.9b. Households having planted fruits and / or flowers by province, district and main source of plants during Season 2008B

## **PRACTICE AND PRODUCTION OF LIVESTOCK**

A 4.4.1a. Total number of agricultural households by province, district by type of livestock  
A 4.4.1b. Agricultural households (%) by province, district by type of livestock  
A 4.4.1c. Households having practiced animal breeding techniques by province, district by type of livestock  
A 4.4.2. Agricultural households with bovine cattle shed, breeding method, and forage source by province and district  
  
A 4.4.3. Agricultural households by province, district and area covered by forage  
A 4.4.4. Total number of cattle by province and district  
A 4.4.5. Total number of small livestock and poultry by province and district.  
A 4.4.6a. Total number of births of livestock by province and district during Season 2008A  
A 4.4.6b. Total number of births of livestock by province and district during Season 2008B  
A 4.4.6c. Total number of births of livestock by province and district in 2008  
A 4.4.7a. Total number of deaths of livestock by Province and District during Season 2008A  
A 4.4.7b. Total number of deaths of livestock by province and district during Season 2008B  
A 4.4.7c. Total number of deaths of livestock by province and district in 2008  
  
A 4.4.8a1. Animal products by province and district during Season 2008A  
A 4.4.8a2. Animal products (%) by province and district during Season 2008A  
A 4.4.8b1. Animal products by province and district during Season 2008B  
A 4.4.8b2. Animal products (%) by province and district during Season 2008B  
A 4.4.8c1. Animal products by province and district in 2008  
A 4.4.8c2. Animal products (%) by province and district in 2008

## **PRACTICE OF PISCICULTURE, FISHING AND APICULTURE**

- A 4.5.1. Households engaged in pisciculture and fishing by province and district...
- A 4.5.2. Fishing households by fishing method, fishing equipments and by province and district
- A 4.5.3a. Fish production and income by province and district during Season 2008A
- A 4.5.3b. Fish production and income by province and district during Season 2008B
- A 4.5.3c. Fish production and income by province and district in 2008
- A 4.5.4. Households engaged in apiculture by province and district
- A 4.5.5a. Number of hives and apicultural production by province and district during Season 2008A
- A 4.5.5b. Number of hives and apicultural production by province and district during Season 2008B
- A 4.5.5c. Annual apicultural production by province and district in 2008

## **FORESTRY PRACTICE AND INCOME**

- A 4.6.1. Distribution of households according to possession of afforestations or scattered trees by province and district
- A 4.6.2a. Distribution of households according to planting of trees and number of planted trees during Season 2008A
- A 4.6.2b. Distribution of households according to planting of trees and number of planted trees during Season 2008B
- A 4.6.3a. Distribution of households according to planting of trees and main source of plants during Season 2008A
- A 4.6.3b. Distribution of households according to planting of trees and main source of plants during Season 2008B
- A 4.6.4a. Forestry Income (in RWF) by province and district during Season 2008A
- A 4.6.4b. Forestry Income (in RWF) by province and district during Season 2008B

- A 4.7.5b. Distribution of agricultural households according to statement on food security during Season 2008B
- A.4.7.6a. Distribution of agricultural households having experienced food insecurity and measures taken during Season 2008A
- A.4.7.6b. Distribution of agricultural households having experienced food insecurity and measures taken during Season 2008B
- A.4.7.7a. Distribution of agricultural households having experienced food insecurity and measures taken during Season 2008A
- A.4.7.7a. Distribution of agricultural households having experienced food insecurity and measures taken during Season 2008A
- A.4.7.7b. Distribution of agricultural households having experienced food insecurity and measures taken during Season 2008B
- A.4.7.7b. Distribution of agricultural households having experienced food insecurity and measures taken during Season 2008B
- A.4.7.8a. Distribution of agricultural households having experienced food insecurity and the current situation of food self-sufficiency during Season 2008A
- A.4.7.8b. Distribution of agricultural households having experienced food insecurity and the current situation of food self-sufficiency during Season 2008B

## CHAPTER 1 – EXECUTIVE SUMMARY

The 2008 National Agricultural Survey (NAS 2008) of Rwanda has been undertaken from September 2007 to August 2008 and covered the whole two agricultural seasons of the year 2008 (from September 2007 to February 2008 for the first season and from March to August 2008 for the second season). The NAS 2008 covered a sample of 10,080 agricultural households spread out in all 30 districts. The data obtained are therefore representative at that decentralized level of districts.

The analysis that has been done dealt with:

- Demographic and social characteristics of agricultural farmers;
- farms characteristics;
- Agricultural practices and crop production;
- Livestock practices and production;
- Fishery, aquaculture and beekeeping practices;
- Forestry practices and income;
- Food stocks and, nutrition.

These are the major themes presented in this report and in which the main results are summarized subsequently.

In 2008, heads of households of Rwandan agricultural farmers presented the following main demographic and social characteristics:

- They constituted 85% of the total heads of households of the country, of which 27% were female;
- They are relatively young as their average age is 44 years and the median between 35-44 years. However, female heads of households are relatively older than men; their average age is 51 years whilst it is 42 years for men;
- 45% of heads of households are illiterate (only 55% can read and write);
- Generally agriculture is the only activity for agriculture households. About 56% don't practice a secondary activity.

Agricultural population is generally characterized by the following elements:

- In 2008, Rwandan agricultural population accounted for 84% of the total Rwandan population, where majority (52% of the total) are women;
- An agricultural household is almost exclusively composed by the family blood members. Only 11% live in household without any parental relationship. On average, two agricultural households include only one person without any parental relationship with the head of household;
- The literacy rate of the agricultural population amounts to 64 %. On ten agricultural households, there are 8 illiterate persons;
- The average size of an agricultural household is 4,9 persons, half of whom constitute 'active persons';

- The main activity undertaken by the majority of the agricultural population consists of farm works to which the women contribute a lot: 42% of the active persons take charge of helping the agricultural families (77% of those are female) and 33% are farmers themselves. It is rare that there is accumulation of activities (as secondary activities), besides the undertaken main activity.

The characteristics of the Rwandan farms can be summarized as follows:

- Farmlands are fragmented plots of land. On average, a farm has only a surface of 0.76 Ha distributed on approximately 4 blocks of lands. Approximately 80% of farms have a surface that does not exceed 1 Ha each. Together, all the farms occupy 12,807 Km<sup>2</sup>, thus representing half of the surface of the country;
- Most of the farms were acquired by inheritance, purchased or received as gift. Other modes of acquisition including sharecropping/rent, free usage, voluntary division (sharing), etc. constitute approximately 12% of the agricultural total area;
- 62% of the area of farms is equipped with anti-erosive devices;
- The quasi-totality of farms are on hills (82% of their area) and near houses (87% of their area are accessible within 30 minutes time);
- It is mostly pluvial traditional crops that are cultivated on the quasi-totality of farmlands (on more than 95% of the area of the farms), and using almost exclusively traditional techniques.

The following results concerning the agricultural practices were pulled by the ENA 2008:

- Rwanda grows a range of varieties of agricultural crops. The major ones are the following: maize and sorghum for cereals, sweet potatoes, cassava (soft and bitter), taro and potatoes for roots and tubers, beans and peas for pulses, Soya beans and groundnuts for oil crops, vegetables dodo, gourds, eggplants, onions and cabbages for vegetables, bananas (for cooking, beer and fruits) and avocados for fruits;
- Horticulture (vegetables, fruits and flowers) is also practiced by a certain number of farmers: 51% and 42% of the agricultural households in season A and B respectively;
- The use of improved seeds and pesticides/fungicides is still low. Every season, approximately 10% and 15% of the agricultural households use improved seeds and pesticides/fungicides respectively. On the other hand, fertilizers are relatively very popular. They are used, jointly or not, by 75% and 62% in season A and B respectively. The most popular are organic fertilizers (the fertilizer from the big and small ruminants as well as the compost): usage in 2008 rose from 38-41% during the first season and 23-33% in the following season. As regards chemical fertilizers, only 18% and 14% had access to them in season A and B respectively.
- The agricultural inputs which are most traded are traditional seeds (between 60-75% of agricultural households buy them every season), agricultural equipments (between 52-68% of the agricultural households buy them every season) and agricultural workforce (50-52% of households pay for it every season). Concerning the pesticide products, only between 20-26% of the agricultural households receive them every season. Only between 7-15% of agricultural households had to buy improved seeds and fertilizers (chemical and organic). Of all the expenses

for agricultural inputs, the cost of labor force was the heaviest on the portfolio of the farmers. This post, itself, represents 40% of all the cost of the agricultural inputs;

- The nutritional equivalent of the production of crop products of 2008 is estimated at 1942 Cal/per/day per, 49 Prot/per/day (in Grs) and 14 Fat/per/day per (in Grs). This production is dominated by roots and tubers (45 % of total vegetal products), followed by fruits, vegetables and cereals, which respectively, contribute for 19.4%, 17.2% and 13.4% of all the calories from vegetal products. All other groups of products (oil crops, vegetables, sugar, stimulants and spices) represent only 5.2% of the total vegetal products.

From the analysis of the results on the practices of livestock, fishery and aquaculture and beekeeping, we note the following:

- 70% of the Rwandan agricultural households are at the same time breeders. The most practiced breeding technique is stalling (78% of the cases). Together with those who practice semi stalling, they constitute 88% of the cases. Most of the breeders (89%) possess cowsheds for their cattle;
- The composition of the herd of animals in Rwanda is varied. In 2008, Rwanda recorded 1,548,521 cattle, 1,736,211 goats, 323,003 sheep, 310,833 pigs, 1,026,440 chickens, 134,645 other poultry, 474,512 rabbits and 292,118 guinea pigs;
- The most favorable season for milk and eggs production is the season B. Indeed, the contribution of the production of cow milk and the hen eggs in season 2008B to the annual total production was 61% and 58% respectively;
- The aquaculture, fishery and beekeeping activities are not very developed in Rwanda. Very few agricultural households have fish ponds or engage in fishery activities. The level of annual total fish production is 3,100 tons. Likewise, only 4% of the farmers practice beekeeping with a total annual honey production of 3,500 tons.

For forestry practices, the following information is to be noted:

- In 2008, approximately 28% of the agricultural households had no trees on their farms. Nevertheless, agricultural household afforestations were their main source of firewood for cooking. Those who didn't have the latter were gleaning some firewood from the public forests or in the neighbor ones, bought it or relied on fragments of tree crops or leaves;
- Nevertheless, enthusiasm for the domestic reforestation is still needed. In 2008, only 23% and 12% of the agricultural households respectively planted new trees during the seasons A and B.
- The average income from forestry was about 6,800 FRW per forester. This came from the sale of timber for construction, charcoal, firewood and sawn wood.

Finally, the modules of the survey on food stocks and the nutrition of agricultural households provided the following indications;

- The most food items in stock are sorghum, dry beans and maize;

- On average, an adult Rwandan living in an agricultural household eats two meals a day and, generally, consumes his/her own products;
- The most popular meals comprise of beans (on average 5 times a week), vegetables, sweet potatoes and vegetables or animal oil (on average 3 times a week). Cassava, Irish potatoes and banana are also a relatively frequent consumption (on average twice a week);
- Nearly half of the agricultural households (47% and 28% during the seasons A and B respectively) declared to have experienced problems of food self-sufficiency (lack of enough food or damaged food), the main causes of which were: the drought/irregularity of rains, the unusual increase of prices, diseases, etc.;
- By the end of each season of 2008, respectively 28% and 41% of the agricultural households were still experiencing food self-sufficiency problems;
- The global level of nutritional equivalent of the domestic total agricultural production is dominated by vegetal products. In 2008, it rose to 1979 Cal/per/day, 50 Prot/per/day and 30 Fat/per/day. 98% and 2% of the calorific contributions are respectively from the vegetal and animal products.

## **CHAPTER 2 - INTRODUCTION**

### **2.1. Survey framework**

The agricultural sector employs nearly 80% of the working population and is characterized by low productivity and low economic value. Almost 90% of households in Rwanda practice a traditional subsistence agriculture which is mainly carried on narrow plots of land and exhausted by a continuous utilization.

The National Agricultural Survey 2008 (NAS 2008) was designed to provide a picture with reliable and updated agriculture sector figures, in order to serve as a baseline based on the facts and to set up development strategies that are most appropriate for the rural sector. This will steer progress towards the goals of Vision 2020, while having the fittest tools for measuring, monitoring and evaluation. Indeed in the context of Vision 2020 adopted by the highest authorities of the country, the transformation of agriculture is one of the pillars of that vision.

A firm commitment was made to:

- Promoting a high-productivity and market-oriented agriculture;
- Increasing productivity (yield); in 2020 subsistence farming will be replaced by a market-oriented agriculture;
- Promoting legal and institutional reforms to ensure the security of land tenure and its optimal use;
- Increasing the value of land capital;
- Investing in rural infrastructure;
- Promoting the use of high yield varieties and intensive use of fertilizers;
- Promoting the installation of agricultural processing facilities in order to create non-agricultural jobs.

To measure progress, a status report on the agricultural sector was needed. Along this line, the National Institute of Statistics of Rwanda, in collaboration with its conventional partners and with the support of donors, all concerned with development of Rwanda, conducted a nationwide agricultural survey which commenced in September 2007. This survey dealt with several activities of agriculture, livestock, forestry, horticulture and fisheries in more than ten thousand sample households over a period of 12 months covering the cycle of successive cropping seasons of the agricultural year 2008. The survey cost was estimated at around 3 billion RWF. The data obtained are disaggregated at the district level and provide a reference and unreported tool for a better knowledge on agriculture sector as it existed in that time period.

### **2.2. Justification of the comprehensive agricultural survey NAS 2008**

As a result of the 1994 genocide, several lives were lost, some of the population was displaced while others were exiled. After these tragic events, and without accurate measurements either qualitative or quantitative, it was not possible to evaluate objectively the performance of the agricultural sector and to know the real contribution of agriculture to the economy. Evaluation of the weight of agriculture has

since been based on some annual agricultural production estimates using projections of an agricultural survey conducted in 1990. However, benchmarks of 1990 are now completely obsolete.

A variety of statistical data on agricultural sector is indispensable for an in depth analysis of the current structure of agriculture in Rwanda in order to define objectives, programs and projects, to monitor and evaluate the impact of these programs and projects.

To address these gaps in performance evaluation of the agricultural sector, the National Institute of Statistics of Rwanda alongside with other state services and key development partners agreed on the need to establish up to date and reliable agricultural statistics through a broad nationwide agricultural survey using a large sample size that will provide baseline data for evaluating performance of the agricultural sector in particular, and the entire national economy in general.

In the EDPRS, it is projected that by 2012, 100% of the farmland will be protected against erosion, the proportion of rural households with any type of livestock will increase to 85%. Such indicators cannot be measured, updated and their progress well known, without a comprehensive and well documented baseline.

It was therefore decided to organize a broad nationwide agricultural survey. The administration restructuring based on decentralization policy has influenced changes to the sample size and the areas of data analysis on agriculture. A solution had to be found for the problem of lack of reference agricultural statistics for planning district development as regards the agricultural sector. A large sample was selected including 10,080 agricultural sample households and an appropriate methodology was followed for further analysis of data at district level.

### **2.3. The objectives of the ENA 2008**

- To provide robust agricultural statistics for evaluating the performance of the agricultural sector, economic development policies and strategies for poverty reduction;
- To provide districts with agricultural baseline data for planning of interventions in the agricultural sector;
- To respond to the strong demand for agricultural statistics such as:
  - Agricultural households (number per district and province);
  - Socio-demographic characteristics of the agricultural households (gender, age, marital status, literacy, education, economic activities);
  - Agricultural lands (size of blocks, fields and farms, location, time of access from the dwelling, acquisition mode of holding, typology of crop, cultivation methods, anti-erosion devices, location of fields) ;
  - Agricultural inputs (agricultural tools and equipment, use of manure and fertilizer, use of pesticides, use of ordinary and improved seeds);
  - Crop production (harvested quantity by crop, sold quantity by crop);
  - Livestock production: inventory of livestock (cattle, goats, pigs, sheep, poultry, rabbits, guinea pigs);

- The practice of breeding (stables, semi stall);
- Flow of animals (born on the farm, dead, etc.);
- Livestock products (milk, eggs, etc.);
- Practice and fishery products and aquaculture;
- Practice and apiculture products;
- Forest production (ownership of afforestations, trees, source of firewood, income from forest production);
- Practice of horticulture;
- Storage of major food crops;
- Food and nutrition (meal frequency, frequency of consumed food items, method of obtaining food, food security status).

## **CHAPTER 3- METHODOLOGY**

### **3.1. Introduction**

The data collection was conducted under the leadership of the Ministry of Agriculture, according to a sampling methodology with representativeness at the level of agro-climatic regions and “prefectures”, dating back to 1983, when the last national agricultural survey was held. Since then, smaller agriculture surveys were conducted in successive years, with representativeness at the prefecture level.

These small surveys stopped in 1992 because of insecurity in the country. During the period of emergency that followed the genocide of 1994, it was imperative to roughly estimate the food availability and nutritional needs of the population in order to program food aid to supply in the short term. That is when the crop assessment campaigns started and this continues every season until today.

The agricultural production figures used so far are always provided by the crop assessment campaigns conducted shortly before the end of each growing season.

Several other surveys have been conducted on the rural sector but none has met the information needs either in terms of quality or in terms of representativeness. We can already cite surveys conducted between 1999 and 2002, by the Food Security Research Project (FRSP) using a representative sample of former prefectures, small farm surveys conducted in 2005 using a sample of 1,440 households and the 2006 which used a sample of 1,704 households

A broad-based survey was therefore necessary to ensure greater representativeness in space and time, observing a larger number of crops and providing a database to meet the agricultural statistics demand in the new context of decentralization, which enshrines districts as a starting point for development and planning. The introduction of new cash crops through horticultural activities deserves also to benefit from the monitoring provided by the survey. Hence this was the rationale of the National Agricultural Survey 2008 (NAS 2008).

### **3.2. Survey scope**

The survey covers all rural areas of the country and some areas of Kigali city concerned by the agro-pastoral activities. The survey was conducted during the two agricultural seasons 2008A and 2008B which cover virtually the entire agricultural year. The same sample of households was visited during each growing season.

Since main users of agricultural statistics wished to have data at the level of districts, the following have been considered as key domain for NAS 2008.

### **3.3. Sampling of NAS 2008**

#### ***3.3.1. Recent developments in the administrative structure of Rwanda***

In 2002, Rwanda was divided into 11 provinces and Kigali City, 106 districts and 1545 Sectors. For purposes of the General Census of Population and Housing (GPHC/ RGPH) in 2002, each sector was divided into *Enumeration Areas* (EAs) with an average size of 227 households. Thus, Rwanda was

divided in 7727 EAs. These enumeration areas were well defined and identifiable on field, so that no EA overlapped on another.

In 2006, the number of decentralized administrative structures was revised downwards. The number of provinces was reduced to 5 (including Kigali City), the number of districts and sectors were reduced to 30 and 416 respectively.

### ***3.3.2. Basic sampling units***

The data for developing the sampling plan of the National Agricultural Survey 2008 come from the RGPH 2002 mapping and census results. The agricultural module that was administered to all households helped to identify agricultural households.

Information extracted from this module was used to develop a sample frame for the National Agricultural Survey. To select the primary sampling units (PSU), the number of agricultural households identified in RPGH 2002 was used as a measure of the size of the enumeration area (EA).

The unit of observation was the agricultural household. This was defined as the household where at least one member was engaged in any of the following; agricultural activities , livestock , fisheries , forestry or bee-keeping. A form for listing was used to identify this type of household. The unit of analysis was the holding of agricultural household. The agriculture sample frame consists of all agricultural households residing in the enumeration area.

### ***3.3.3. Primary Sampling Unit (PSU)***

At the first stage, the primary units of sampling (PSUs) constituted the sample frame of survey. The PSUs were geographical areas with clearly identifiable boundaries so that the listing of households was conducted by an enumerator during a fixed period of time. The sample EAs were drawn using probability proportional to size (PPS), the size of each PSU is the number of households. To ensure efficiency of the sample, it was expected to draw 840 EAs across the country.

### ***3.3.4. Secondary Sampling Units (SSU)***

The units that constitutes the frame in the second stage - in a two stage sampling - called Secondary Sampling Units (SSU) were formed by all agricultural households residing in the sample EA , from which a number of households were selected. The number of sample households by EA was determined such that the workload enabled the enumerator to complete the collection work on time. 12 agricultural households by EA were selected for data collection.

The selection was made so that all types of agricultural farmers, all types of crops and livestock and all cultures were represented in the sample.

### ***3.3.5. The selection of sample households***

After the selection of 840 primary units corresponding to the enumeration areas established during RGPH (2002) and using the principle of probabilities proportional to size, listing within sample EAs was done in order to establish the updated list of households residing in the EA. This operation led to identification of agricultural households. These lists of agricultural households helped for random selection of 15 agricultural households by EA with equal probability. Among these 15 households, 12 participated in interviews and 3 agricultural households served as replacements in case of failure or refusal to be surveyed by the other households.

### ***3.3.6. The stratification of the NAS 2008***

The first stage of stratification was at the district level in order to have the survey estimates at the district level. The districts of Kigali City (Nyarugenge, Gasabo, Kicukiro) were grouped into one stratum because of the small number of agricultural EAs in each district. Thus, at the first stage of stratification, there are 28 independent strata which corresponded to the domains of analysis: the City of Kigali and each of the 27 remaining districts.

Furthermore, Rwanda was divided into ten bio- climatic zones. Considering that the agricultural and livestock production was closely linked to bio climatic zones, implicit stratification following the "bio-climatic zones" increased the efficiency of sampling. Implicit stratification consisted of ordering the EAs in each stratum by the criterion of choosing before the selection of the PSU.

The bio-climatic zones are defined as follows:

- (01) Cyangugu countryside
- (02) Banks of Lake Kivu
- (03) Cones and high volcanic planes
- (04) Congo Nile Ridge
- (05) Ridges and plateau bordering the Savanah of the east
- (06) Buberuka Highlands
- (07) Mayaga and Bugesera
- (08) Plains of Bugesera
- (09) Central Plateau
- (10) Savannah of east and central Bugesera

Each agricultural EA was classified into one of the ten bio climatic zones. The analysis of agricultural sample frame showed that most districts (19) had two bio climatic zones, 6 districts had three bio climatic zones, 2 districts (Musanze and Nyamasheke) had 4 zones and 3 districts were in a single agro climatic zone.

### 3.3.7. Sample size and precision of estimates

The desired size for the sample was determined by taking into account several factors, including the three main ones; the degree of reliability expected of survey estimates, cost and the efficiency of the sample. However, the precision of estimates from the survey depended on the effective control of sampling and non-sampling errors. In consideration of financial and operational constraints, and in order to have reliable estimates at district level, it was suggested to select 840 EAs at the first stage. This proposed sample was divided into 4 sub-samples of 210 EAs for each in preparation of subsequent light surveys (including the Survey of post harvest crop production, etc..) and according to resources that could be mobilized.

In the second stage, 12 households were selected in each sample EA. For the National Agricultural Survey 2008, there were a total of 10,080 sample households.

### Sample distribution

**Table 3.3.1. Distribution of the agricultural base and distribution of sample EAs per district**

District	Number of EAs	Total agricultural households	% Agricultural households	Prorate	Adjustment of the number of EAs
VK (Gasabo, Kicukiro, Nyarugenge)	214	45800	3.0%	25	<b>28</b>
BUGESERA	230	56329	3.6%	31	<b>32</b>
BURERA	300	66683	4.3%	36	<b>32</b>

### 3.4. Weighting procedures

To make sample estimates from the Agricultural Surveys representative for all agricultural households of the country, it was necessary to multiply the data by a sampling weight, or expansion factor. The basic weight for each sample agricultural household was equal to the inverse of its probability of selection. This probability was obtained by multiplying the probabilities at each stage of selection.

$$p_{hi} = \frac{z_h \times M_{hi}}{M_h} \times \frac{m_{hi}}{M'_{hi}},$$

where:

$p_{hi}$  = probability of selection for the sample agricultural households in the  $i^{th}$  sample EA in stratum  $h$

$z_h$  = number of sample EAs in stratum  $h$

$M_h$  = total number of agricultural households in the frame (based on RGPH 2002 / Rwanda Census) for stratum  $h$

$M_{hi}$  = total number of agricultural households in the frame for the  $i^{th}$  sample EA in stratum  $h$

$m_{hi} = 12$  = number of sample agricultural households selected in the  $i^{th}$  sample EA in stratum  $h$

$M'_{hi}$  = total number of agricultural households listed in the  $i^{th}$  sample EA in stratum  $h$

The basic sampling weight, or expansion factor, was calculated as the inverse of this probability of selection.

$$W_{hi} = \frac{M_h \times M'_{hi}}{z_h \times M_{hi} \times m_{hi}},$$

where:

$W_{hi}$  = basic weight for the sample agricultural households in the  $i^{th}$  sample EA in stratum  $h$

$m_{hi} = 12$  = number of sample agricultural households originally planned to be selected in the  $i^{th}$  sample EA in stratum  $h$

To take into account the noninterview rate during data collection, expansion factor is adjusted as follows:

$$W'_{hi} = W_{hi} \times \frac{m_{hi}}{m'_{hi}},$$

where:

$W'_{hi}$  = final weight of sample household in the  $i^{th}$  sample EA in stratum  $h$ ;

$m_{hi}$  = 12 = number of sample agricultural households originally planned to be selected in the  $i^{th}$  sample EA in stratum  $h$

$m'_{hi}$  = total number of actually interviewed sample households in the  $i^{th}$  sample EA in stratum  $h$

### 3.5. Data collection

The data collection was done using questionnaire sheets which were filled by enumerators according to a harmonized calendar in all selected EAs. Each enumerator had to work in two EAs and visit 12 households per EA, i.e 24 households per enumerator. Through the questionnaire sheets, it was possible to collect a large quantity of figures that made it possible to measure several indicators related to farming and livestock breeding within sample households. To fill questionnaire sheets, it was necessary to visit each sample households several times. The questionnaire sheets used are presented in Annex 2.

In addition to the collection sheets in the NAS 2008, the concern of measurement of accuracy was satisfied through the distribution to enumerators and heads of households standard measurement equipments. This was done in order to break the tradition of approximation of quantities and distances as used in previous surveys. Thus, each enumerator was equipped with a measuring tape to get data regarding the dimensions of fields and farms, a spring balance to measure the weights of harvested crops and a calculator. Each household received a bucket calibrated in liters to measure liquid products, a spring balance and a sack to measure the weight of solid products and a pencil to record the amounts collected regularly on an appropriate register.

Regarding supervision of data collection, a statistician appointed in each district by NISR assumed the role of coordinator of field activities. For this, all the statisticians received transport facilitation from NISR with a vehicle for monitoring during at least 7 days per month per district. District statisticians and survey controllers at district level also received monthly telephone cards worth 20,000 RWF in order to maintain contact with field workers.

The enumerators had previously received in the beginning of agricultural season, a calendar for filling questionnaires sheets. At specific times, under the guidance of the survey management team, the enumerators proceeded to rally district by district, to deliver and check the filled questionnaires.

At national level, a supervision team carried out missions to intervene on the ground and to solve any problems of discipline and disorganization.

The collection staff on site was composed of:

- 428 enumerators working in the districts (14 to 18 per district);
- 56 controllers ie 2 controllers by District / stratum.

### **3.6. Data processing**

#### **3.6.1. Data Entry**

Upon the closing of fieldwork of season 2008A, a large volume of data was available for entry. This required a consistent supply and a significant number of staff input to recruit and employ. Unfortunately, organizational and financial difficulties arose and led to a late start of data entry.

For data entry operations, a computer program was developed using a CSPro statistical software application with a questionnaire on each sheet. A training session was organized on this data entry program and on the nature and extent of work to do. In total, this operation mobilized 184 data entry clerks, 10 controllers, 3 checkers, 3 supervisors of coding and 92 computers. A first team of data entry clerks, controllers and checkers worked in the morning and was be relayed by a second team to work in the evening.

Data entry was done in two steps:

##### ***a) Data entry of the 2008A season: from June to July 2008***

The preparation of this step consisted of checking completed forms and returning to site in case of improperly completed sheets, for correction. From 23/06/08 to 12/07/08, three field supervisors skilled in surveys conducted a mission at the headquarters of the NISR in order to help in organizing, supervising and coaching data entry clerks. They played the role of controllers and checkers of coding during the data entry period.

##### ***b) Data entry of the 2008B season: from September to November 2008***

As it was not possible to return to field records improperly completed during the 2008B season at the end of the field work, special instruction was given to field workers to undertake collectively a verification and correction of errors in questionnaires before delivering them to the headquarters of NISR. This instruction was observed by all fieldworkers. Subsequently, the data entry was done with the support of the same controllers and checkers of coding.

### **3.6.2. Data cleaning and processing**

A computer statistician consultant<sup>1</sup> was recruited for the cleaning work and data processing for NAS 2008. The methodology followed in cleaning and processing the data is contained in the document «*Plan méthodologique pour l'apurement et le traitement des données*» formulated by the consultant. The consultant had to monitor compliance with the codification of collection sheets and make the necessary corrections.

---

<sup>1</sup> Mr. Jean-Marie Vianney Sehene

### **3.7. Data analysis**

An international consultant has been recruited to carry out the analysis of the NAS 2008<sup>2</sup>. The analysis covered the demographic and social characteristics of agricultural farmers, farms characteristics, agricultural practices and crop production, livestock practices and production, fishery, aquaculture and beekeeping practices, forestry practices and income, as well as food stocks and nutrition of agricultural households. At this end, the following steps were followed:

#### **3.7.1. *Consultation of documents and technical and methodological survey reports***

The first task was the reading of all technical and methodological survey reports and with the members of NISR technical team who were in charge of the design and the implementation of the survey. That step was very important as it allowed better understanding of how and why the survey was designed, planned and implemented; it was also an opportunity to understand possible problems that may have occurred. This therefore helped for the right evaluation of the resulting data quality.

The reading also covered reports and documents containing information on agricultural development policy prevailing in Rwanda. Indeed, chosen survey modules were targeting to provide benchmark data in order to help decision making vis-à-vis the required strategy in the framework of the national agricultural policy. Hence, it is through the analysis of data obtained in regards of the objectives of that policy that the data analysis has been conducted.

#### **3.7.2. *Consultations with partners***

In order to achieve a good understanding of the way the survey was designed and conducted, consultations with concerned partners were undertaken. In addition to concerned NISR technical staff with whom permanent discussions were maintained, the consultations also included other key data producers and users in Rwanda as well as survey field staff. In this way, everybody contributed to the improvement of the data analysis exercise. The final outcome is therefore considered as a team work output. At the same time, it responded to the expectation of users.

To this end, the preliminary results of the survey were shared and discussed together with key required partners (through a technical meeting organized for this purpose). Observations raised from that meeting were considered for the revision and finalization of data tabulation. It is at that point that the actual data analysis was initiated.

---

<sup>2</sup> Mr. Vincent Ngendakumana

### **3.7.3.      *Verification of the preliminary results of the 2009 NAS of Rwanda***

It was important to proceed with an in-depth verification of the preliminary survey results for the following main reasons. Firstly, in order to ensure that any needed information was produced in the required format; secondly, to ensure that the data produced was reliable, consistent and coherent; and lastly, in order to make possible data corrections and/or adjustments (with the help of the computer specialist recruited for data cleaning and processing). Particular attention was paid to the right use and respect of standard and international related concepts, definitions and classification of agricultural products.

### **3.7.4.      *Collection and compilation of agricultural routine data***

Frequently, 2008 NAS results were compared to other preexisting routine data (according to their availability and reliability). For that reason, it was important to proceed first with routine data compilation from surveys conducted in the past by other partners (especially agricultural production, yield and area, and livestock numbers and production MINAGRI). A relevant format for the compilation of data was used. The obtained data was used as baseline in order to evaluate the reliability of NAS results. In this way, some data, like those on cash crops (coffee and tea) traditionally produced by their respective systems (OCIR-Café and OCIR-Thé), revealed themselves to be well in line with those from the NAS 2008. Discrepancies observed at the level of other data from other sources was explained mainly by gap and weaknesses noticed with methodological approaches used. Therefore, this cannot make questionable, the reliability of the NAS 2008 results published herein.

On the other hand, usage of other parameters (like the technical conversion factors, nutritional factors) for the generation of supplementary data allowed better appreciation of the relevancy of NAS 2008 results. It is by doing so that the conversion of the agricultural productions in nutritional equivalent allowed the conclusion that they were well of a very reasonable level and that they deserved to be accorded acceptable accuracy.

### **3.7.5.      *Analysis of the NAS 2008 results and preparation of the report of analyzed results***

The themes of analysis of the results were previously agreed upon and were based on the questionnaire's modules. Prior to the analysis work, a detailed plan of the report was established and agreed upon and the contents of different chapters and sections of the report were thereafter elaborated.

The analysis was done after the data was extensively verified and approved. The analysis work consisted of explaining (in simple and relevant terms) and pointing out prominent facts emerging from the survey results. A geographical comparative analysis was made at district and provincial levels of the country. Whenever needed and possible, the data analysis was supported by graphic and/or cartographic representation of important phenomena. For some particular cases, and as mentioned in the section 3.7.4, one had to resort to supplementary information in order to generate specific additional indicators.

It has to be noted here that data on crop yield (as obtained from the NAS 2008) proved to be unreliable. This lack of reliability was explained by the fact that a sample of only two holdings by EA was considered for the choice of crop-cutting plots. As a result, the option of not publishing that data was therefore taken.

## CHAPTER 4 – ANALYSIS OF MAIN SURVEY RESULTS

### 4.1. Demographic and social characteristics of agricultural householders and population

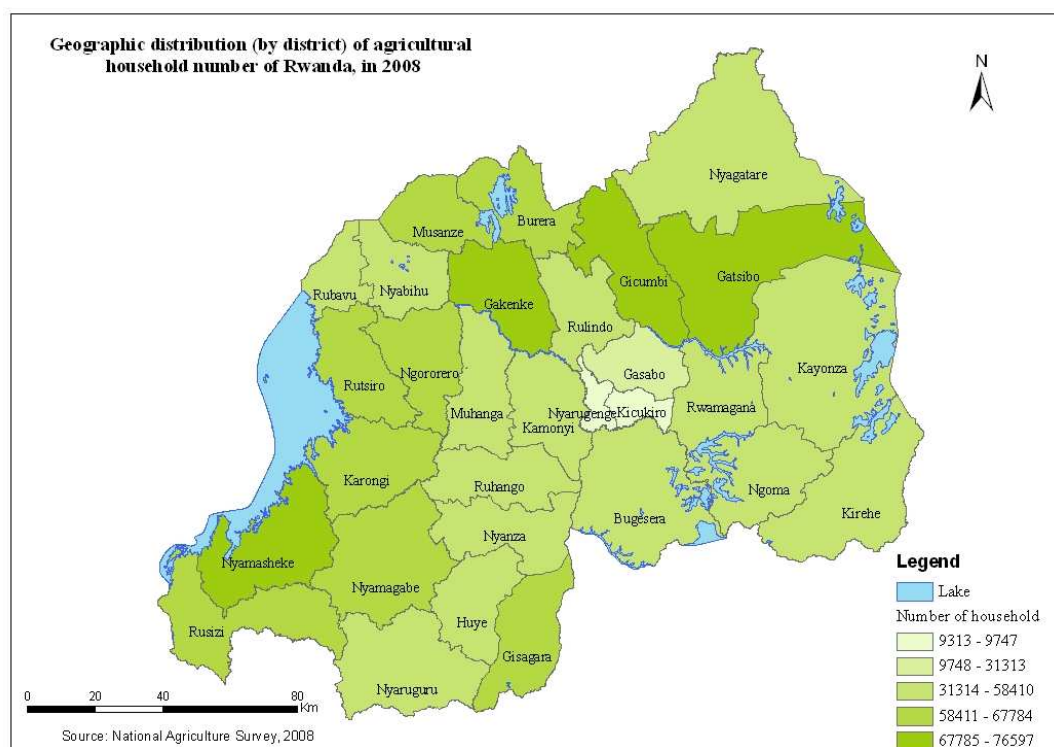

#### 4.1.1. Characteristics of heads of agricultural households

a) 85% of Rwandan heads of households are agricultural farmers, of which 27% are female.

From the agricultural survey conducted in 2008, it was revealed that, Rwanda counted 1,674,687 agricultural households at the time, accounting for 85% of the total number of households of the country<sup>3</sup>.

The male heads of agricultural households represented 73% of the national total, while female were 27%. Those proportions are steady at the level of provinces and districts. In some districts like Gasabo, Nyanza, Gisagara, Nyaruguru, Huye, Rubavu et Rwamagana, the proportion of female heads of households was even above the level of 30%. The level of female heads of households which is relatively high is explained by the fact that many women became widows as a result of the genocide of 1994 (see map 4.1.1 and 4.1.2, table 4.1.1 and chart 4.1.1. below as well as the table A.4.1.1. in annex). This is also confirmed by the table 4.1.2 which deals with the matrimonial status of the head of household. It can be observed from the table that the category of widowers heads of households comes in the second position (after the one of legally married) and represents about 20%, almost all of them being constituted by women.

Map 4.1.1. Geographic distribution (by district) of agricultural household number of Rwanda, in 2008.

<sup>3</sup> It is estimated that, in 2008, the country counted 9,831,501 persons, with an average of 5 persons per household.

Map 4.1.2. Proportion of heads of agricultural households by district and sex in 2008

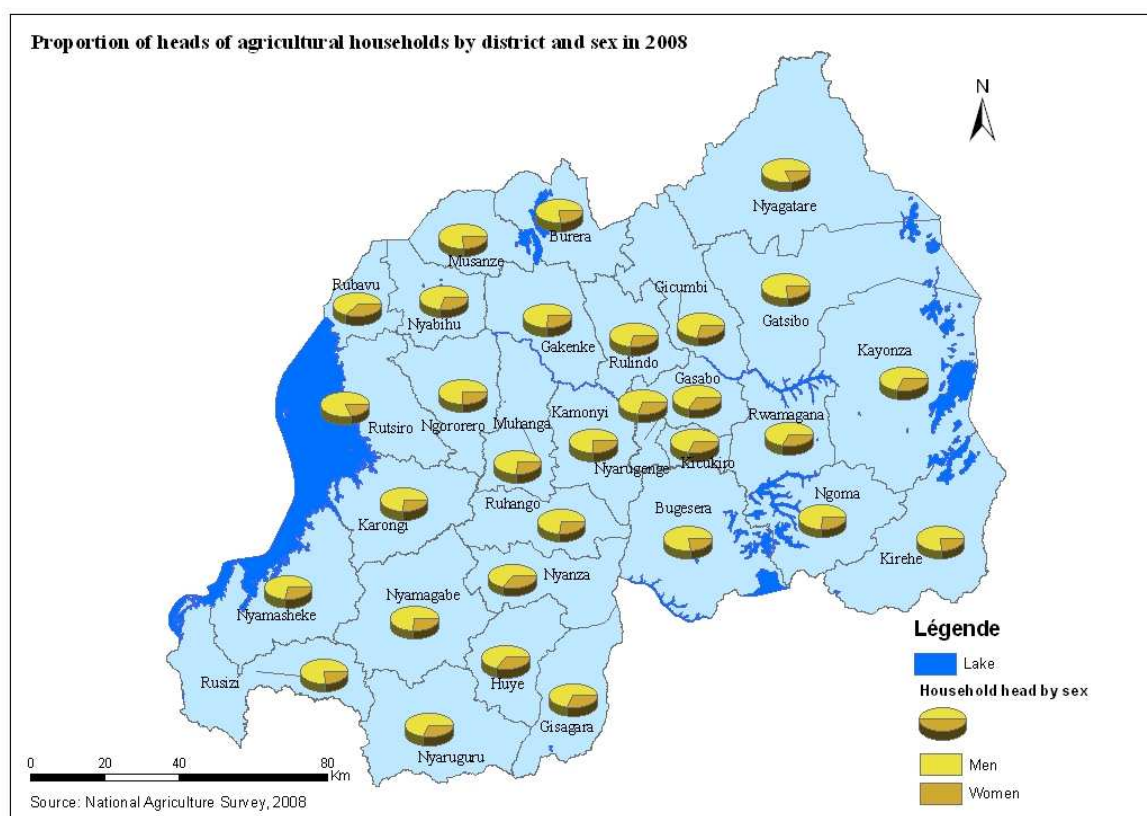

Table 4.1.1. Distribution of agricultural households by provinces and the sex of the head of the household

Provinces	Sex of the head of the household					
	Male		Female		Total	
Kigali City	34 483	68.5%	15 890	31.5%	50 373	100%

*b) The heads of agricultural households are relatively young in Rwanda.*

This survey also revealed that the heads of Rwandan agricultural households are relatively young. Their average age is about 44 years. Among them, more than 75% are less than 54 years old, while the age median is situated between 35-44 years (see table 4.1.3 and chart 4.1.2 below). Besides, female heads of households are relatively older than men. Indeed, their average age is 51 years whilst it is 42 years for men (see table 4.1.4 and chart 4.1.3). These facts are also noticed at provinces and districts level of the country (see table A.4.1.2 in annex).

Table 4.1.3. Distribution of agricultural households by age and the sex of the head of the household

North	42	50	44
East	41	49	43
<b>Total</b>	<b>42</b>	<b>51</b>	<b>44</b>

**Chart 4.1.3. Average age of the head of the household by province and sex**

c) *The literacy rate of heads of agricultural households is still low in Rwanda.*

During the year of the survey, the rate of literacy of head of agricultural household was estimated at about 55% (those who could read and write ); the illiterate and those who were able to read only were 37.8% and 7.4% respectively (see table 4.1.5 and chart 4.1.4 below). This is true since those who had never been at school rose to 32.8%; to the former, it has to be added those who stopped their studies just at the beginning of the primary school (see table 4.1.6).

Table 4.1.5. Distribution of agricultural households by the level of literacy and the sex of the head of the household

Level of literacy	Sex of the head of the household					
	Male		Female		Total	
Cannot read nor write	350 742	28.7%	282 606	62.4%	633 348	37.8%
Can read only	90 326	7.4%	34 114	7.5%	124 440	7.4%
Can read & write	781 031	63.9%	135 868	30.0%	916 899	54.8%

Complete university/high school	3 269	0.3%	0	0.0%	3 269	0.2%
<b>Total</b>	<b>1 222 100</b>	<b>100.0%</b>	<b>452 588</b>	<b>100.0%</b>	<b>1 674 687</b>	<b>100.0%</b>

*d) Secondary activities are rarely practiced by the heads of Rwandan agricultural households.*

The table 4.1.7 below shows that, outside the farming activities, the heads of agricultural households rarely practiced other secondary activities. Indeed, 56.3% of them declared not to undertake any secondary activity. The rare activities, in addition to the main one which is farming, are the following: agricultural manpower (7.9%), independent craftsman (5.5%), non-agricultural manpower (3.9%), house help (3.9%), etc.

Table 4.1.7. Distribution of agricultural households by activity and sex of the head of the household

Main activity	Sex of the head of household

#### 4.1.2. Characteristics of Rwandan agricultural population

- a) The agricultural population counted 84% compared to the total Rwandan population (in 2008), with a relatively important part of women.*

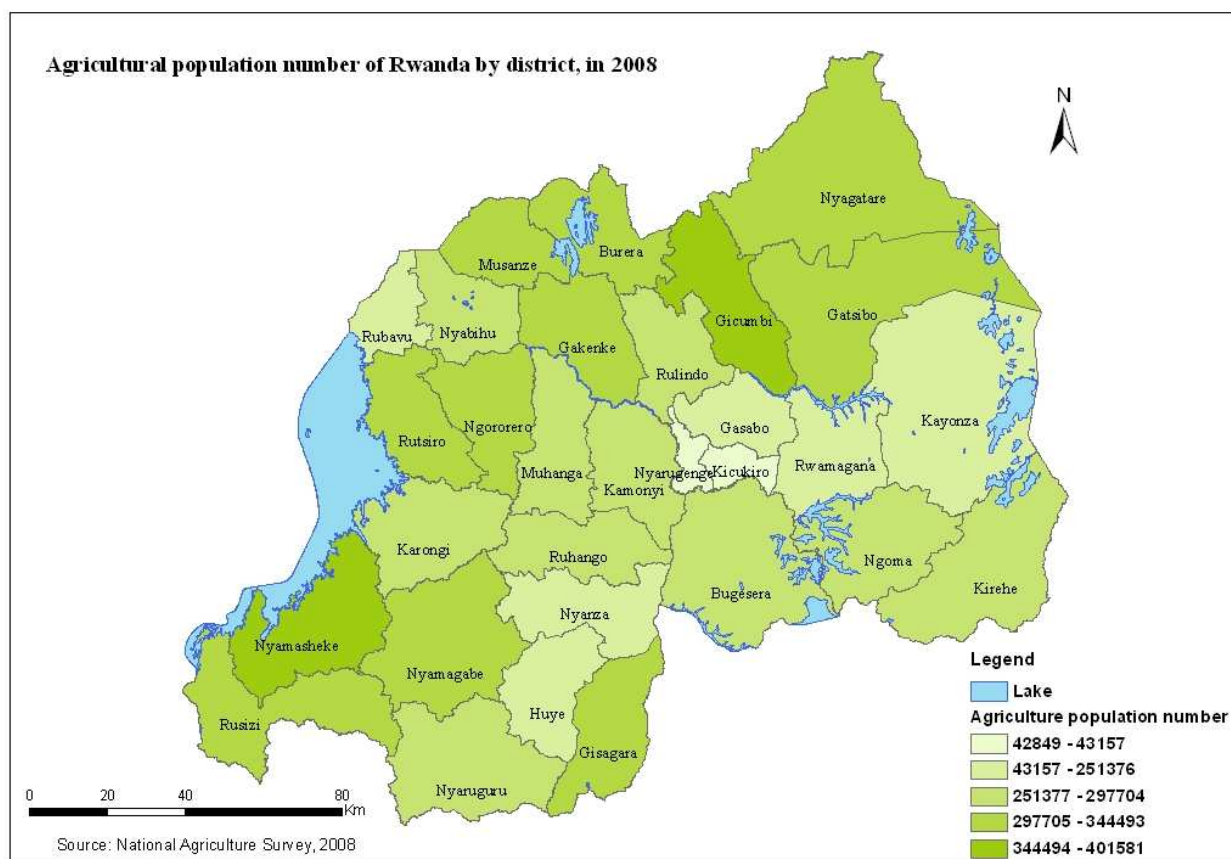

From the agricultural survey conducted in 2008, it was noticed that Rwanda had an agricultural population of 8,283,844 people. The total population being estimated at 9,831,501 inhabitants in 2008, this constitutes a proportion of 84% of agricultural population. Its geographical distribution (by district) is presented through the below map 4.1.3.

The table 4.1.8 below shows the predominance of female agricultural population of Rwanda, in 2008 (52,2% of the total agricultural population), and this, at the level of districts and provinces (see the map 4.1.2 below and the table A.4.1.4 in annex) as well as at all levels of age (see the table 4.1.10 and the chart 4.1.5 below).

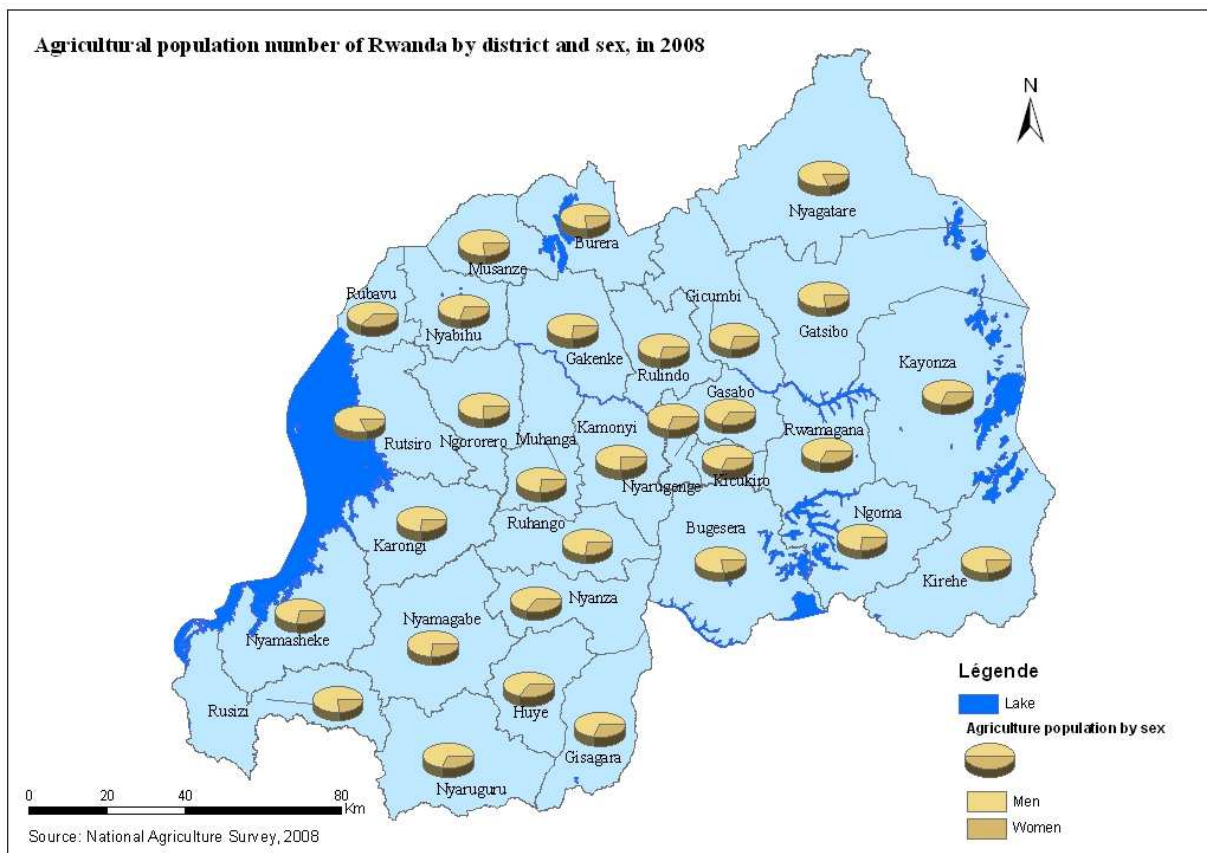

**Table 4.1.8. Distribution of the agricultural population by province and sex**

Province	Men		Women		Total	
Kigali City	121 283	49.2%	125 187	50.8%	246 470	100%
South	1 050 279	47.5%	1 160 355	52.5%	2 210 634	100%
West	1 050 801	47.5%	1 163 134	52.5%	2 213 935	100%
North	780 908	47.9%	848 292	52.1%	1 629 200	100%
East	954 015	48.1%	1 029 589	51.9%	1 983 604	100%
<b>Total</b>	<b>3 957 287</b>	<b>47.8%</b>	<b>4 326 557</b>	<b>52.2%</b>	<b>8 283 844</b>	<b>100%</b>

**Map 4.1.3. Agricultural population number of Rwanda by district, in 2008**

Map 4.1.4. Agricultural population number of Rwanda by district and sex, in 2008

**Chart 4.1.5. Agricultural population by age and sex**

*b) An agricultural household is almost exclusively composed by the family blood members.*

The proportion of agricultural population living inside the household without any direct parental relationship with the head of household amounted to 10.6%. In fact, beside the heads of households themselves and their spouses (respectively 20.2% and 13.7% of the total agricultural population), their children, only constituted 55.5%. As the average size of an agricultural household was 4.9 persons (see table 4.1.13), it follows that, in two agricultural households live, on average, there is only one person who does not belong directly to the family. It is the same situation at the level of all provinces and districts of the country (see table 4.1.9 below and table A.4.1.5 in annex).

It goes therefore to say that the Rwandan agricultural population is largely constituted of the young people of whom 56% are of age less than 20 years old (see table 4.1.10 below, chart 4.1.5 above and table A.4.1.7 in annex).

Table 4.1.9. Distribution of the agricultural population by their relationship with the head of the household

Parental relationship with the head of household	Number	%
Head of household	1 674 687	20,2%
Spouses	1 137 123	13,7%
Children of the head of household	4 596 825	55,5%

c) *The literacy rate as well as the education level of Rwandan agricultural population are still low.*

During the 2008 agricultural calendar year, it was established that 21.7% of the population aged 6 years and above never frequented school and that a significant proportion (53.5%) has attended but not finished primary school (see table 4.1.11 below). Those proportions were maintained at the level of provinces and districts.

This explains why the literacy rate of the Rwandan agricultural population tends to be low. It was indeed evaluated that only 63.7% of people of 15 years old and above could read and write. The illiterate population and those who, at that time, were able to read only, amounted to 29.3% and 6.9% respectively (see table 4.1.12 and chart 4.1.6 below). Here also, those proportions were maintained at the level of provinces and districts (see map 4.1.5 below and the table A.4.1.9 in annex).

Table 4.1.11. Distribution of the agricultural population aged 6 years and above according to the level of education

Level of education	Number	%

**Chart 4.1.6. Distribution of the agricultural population aged 15 years and above according to the literacy level**

**Map 4.1.5. Literate and illiterate agricultural population of Rwanda by district, in 2008**

d) In one given Rwandan agricultural household, half of its members are active.

In general, the average size of a Rwandan agricultural household was 4.9 persons. It has to be noted here that in 2006, like in 2008, the same number was always reported. Among the household members, 2.4 persons were active (are between 15-64 years old), the remaining other 2.5 were inactive (children and old people). It was also observed that 10 agricultural household count, on average, 8 illiterate persons and 18 persons who are able to read and write (among the population of 15 years old and above). Those standards were always maintained at provinces and districts level of the country (see table 4.1.13, chart 4.1.7 and maps 4.1.6 and 4.1.7 below as well as the table A.4.1.10 in annex).

**Table 4.1.13.** Structure of the agricultural population of provinces by their level of literacy, activity age and sex

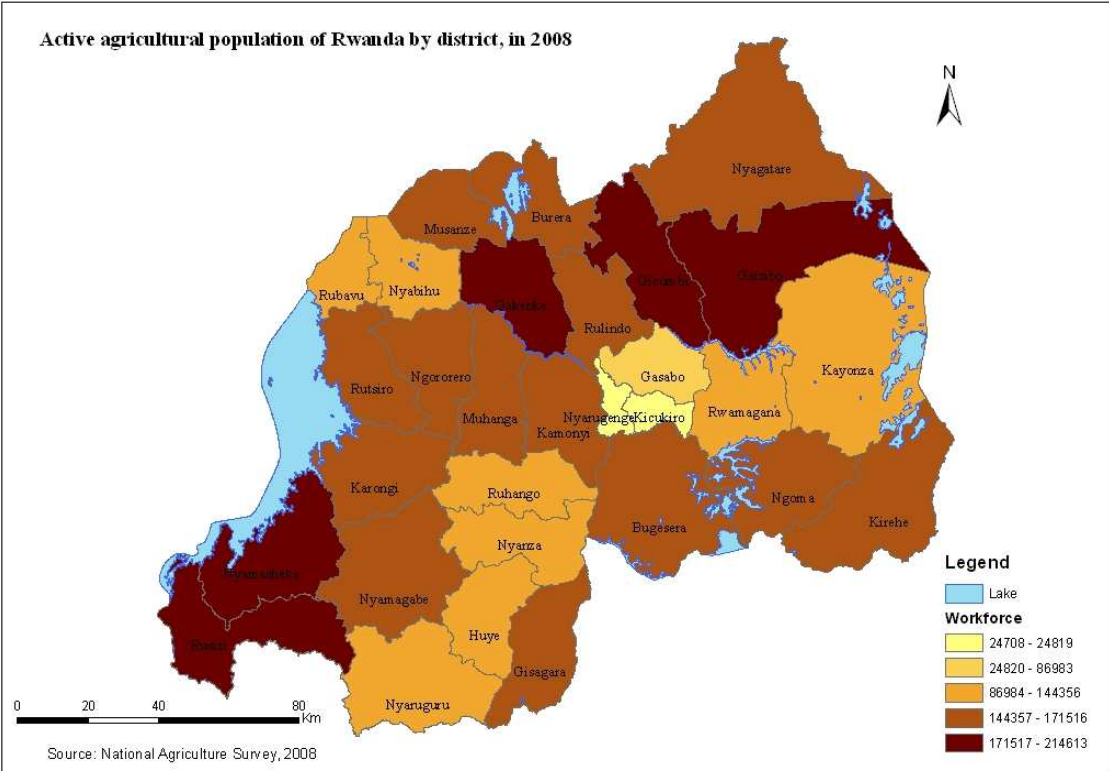

Provinces	Number of people of 15 years old and above			Active persons (15 to 64 years old)/ household	Inactive persons (0 to 14 years and 65 years & above/ household	Men/ household	Women/ household	Size of the household
	illiterate/ household	Persons that can read only/ household	Persons that can read & write / household

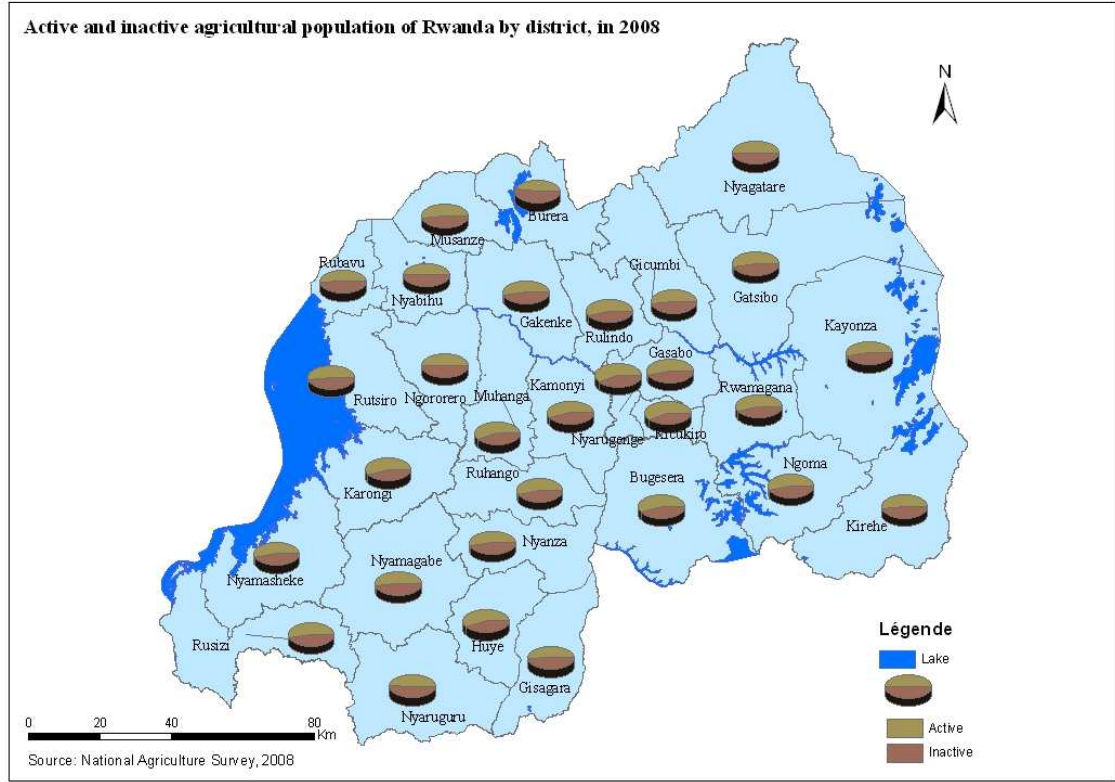

Map 4.1.6. Active agricultural population of Rwanda by district, in 2008

Map 4.1.7. Active and inactive agricultural population of Rwanda by district, in 2008

- e) *The main activity practiced by the majority of the Rwandan agricultural population consists of farm works and the women contribute to it a lot.*

The survey of 2008 revealed that the main activity practised by the majority of the agricultural population consisted of agricultural family help (in 42.2% of cases, among which 77.2% constituted of females). The farmers themselves amounted to 33.3% of active population, while students represented 14.3% of cases. Accumulation of activities (as secondary activities), apart from the main one was rarely observed (see table 4.1.14 below). It has to be noted also that, in general, there was no activity practiced by people of 15 years old or less (outside those going to school or helping to household activities of the family). Therefore, in Rwanda, there is no child labor. It has to be underlined that the group of persons working as agricultural family help was mainly composed of female (77.2% of cases). This shows the importance of the role played by women in the handling of farm works.

**Table 4.1.14** Distribution of active agricultural population (of 15-64 years old) according to the sex and the main and secondary activity practiced

## 4.2. Farm characteristics

### 4.2.1. Area and use of arable lands

a) Farmland area represented half of the whole country area and is constitutes by split plots of land.

From the table 4.2.1 below, it is shown that the average area of farmlands was of 0.76 Ha by household in 2008, divided into about 4 blocks of lands. Those farmlands were on a total area of 1,280,750 Ha, which constituted half of the country total area. That area does not change much from one season to another (see map 4.2.1).

In addition, it is noticed that about 80% of farmlands do not measure more than 1 Ha each (see table 4.2.2).

Similar information is detailed by province and district and is presented in annex, from table A.4.2.2a to A.4.2.3a.

Map 4.2.1. Total area of agricultural land of Rwanda by district, during the two seasons of 2008

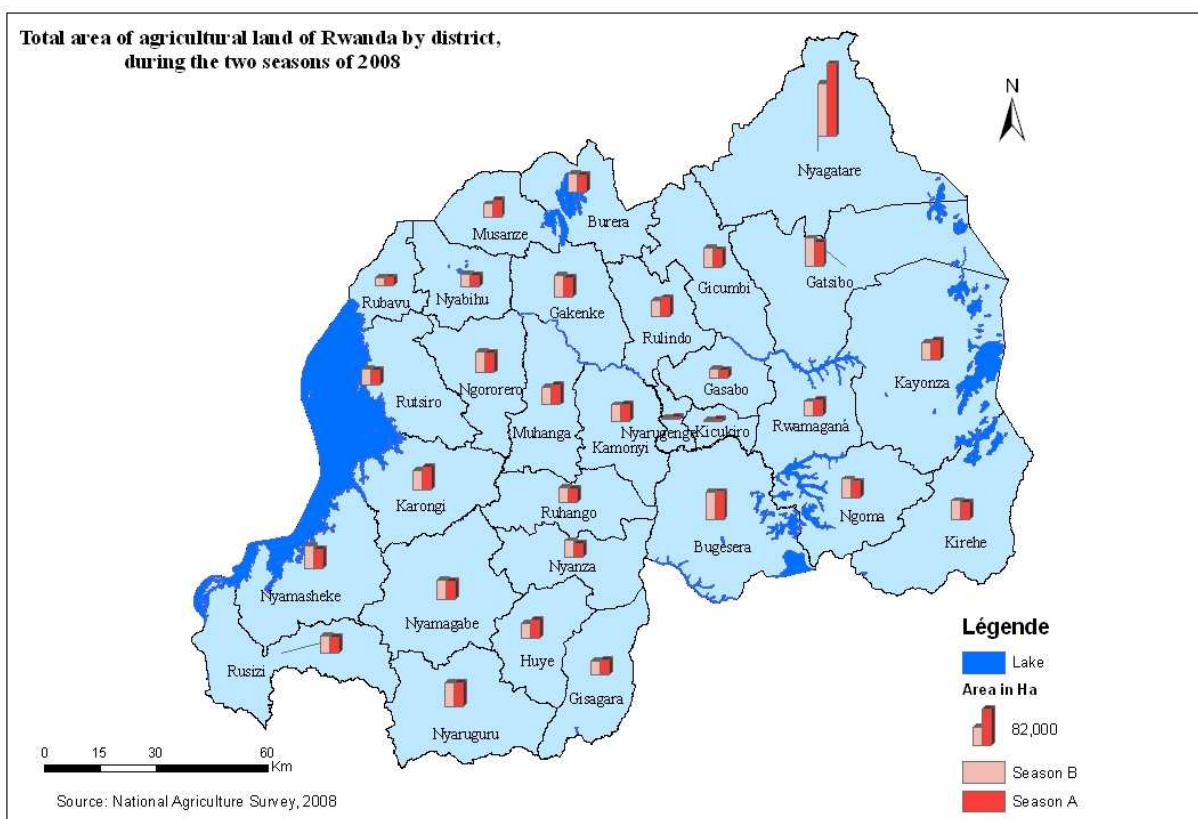

Table 4.2.1. Area coverage rate of agricultural holdings, average area by agricultural household (Ha) and average number of blocks by household

Province	Total area by province <sup>4</sup>	Area under agricultural holdings (Ha)	Area coverage rate of agricultural holdings (%)	Average area by agricultural household (Ha)	Average Number of blocks by household
Kigali City	72 985	32 959	45.20%	0.65	3
South	596 352	327 047	54.80%	0.71	4
West	588 173	269 964	45.90%	0.62	4

<b>Total</b>	<b>2 531 310</b>	<b>1 280 750</b>	<b>50.60%</b>	<b>0.76</b>	<b>4</b>

Table 4.2.2. Proportion (%) of agricultural holdings by the size of their area (in Ha)

Area intervals	Percentages	Cumulative %
<0.20 Ha	26.3%	26.3%
0.20 – 0.49 Ha	30.5%	56.8%
0.50 – 0.99 Ha	23.2%	80.0%
1.0 – 1.99 Ha	14.0%	94.0%
2.0 – 2.99 Ha	3.6%	97.6%
3.0 – 3.99 Ha	1.2%	98.8%
4.0 – 4.99 Ha	0.6%	99.4%
5.0 – 9.99 Ha	0.5%	99.9%
10.0 – 19.99 Ha	0.1%	100.0%
20.0 – 49.99 Ha	0.1%	100.0%
50.0 – 99 Ha	0.1%	100.0%
<b>Total</b>	<b>100.0%</b>	

*b) Most of farms were acquired by inheritance, purchased or received as gift.*

The table 4.2.3 shows that 81.5% of the farmlands were acquired by inheritance, purchased or received as gift. The proportion of those received as gift (11.3% of total agricultural area) seems to be odd. In fact, as a result of the genocide of 1994, some survivors were able to obtain a part of the lands that belonged to some of their deceased family members. Also, it is likely that "to receive in inheritance" and "to receive in gifts" were poorly understood by the sample farmers.

<sup>4</sup> Source: Ministry of Agriculture and Animal Resources.

Table 4.2.3. Proportion (%) of agricultural lands according to land tenure type

Land tenure type	Percentage
Inheritance	45.5%
Purchase	24.7%
Received as gift	11.3%
Free usage	2.1%
Sharecropping/Rent	6.7%
Voluntary sharing	2.3%
Gift from the State	6.7%
Other	0.7%
<b>Total</b>	<b>100.0%</b>

*c) 62% of the area of farms is provided with anti-erosive devices.*

According to the chart 4.2.1 and the table 4.2.4 below, it is shown that a significant part of farm area was provided with anti-erosive devices. It was the same situation prevailed at the level of most of the districts of the country (see map 4.2.2).

Map 4.2.2. Proportion of agricultural area provided with anti-erosive devices by district, in 2008

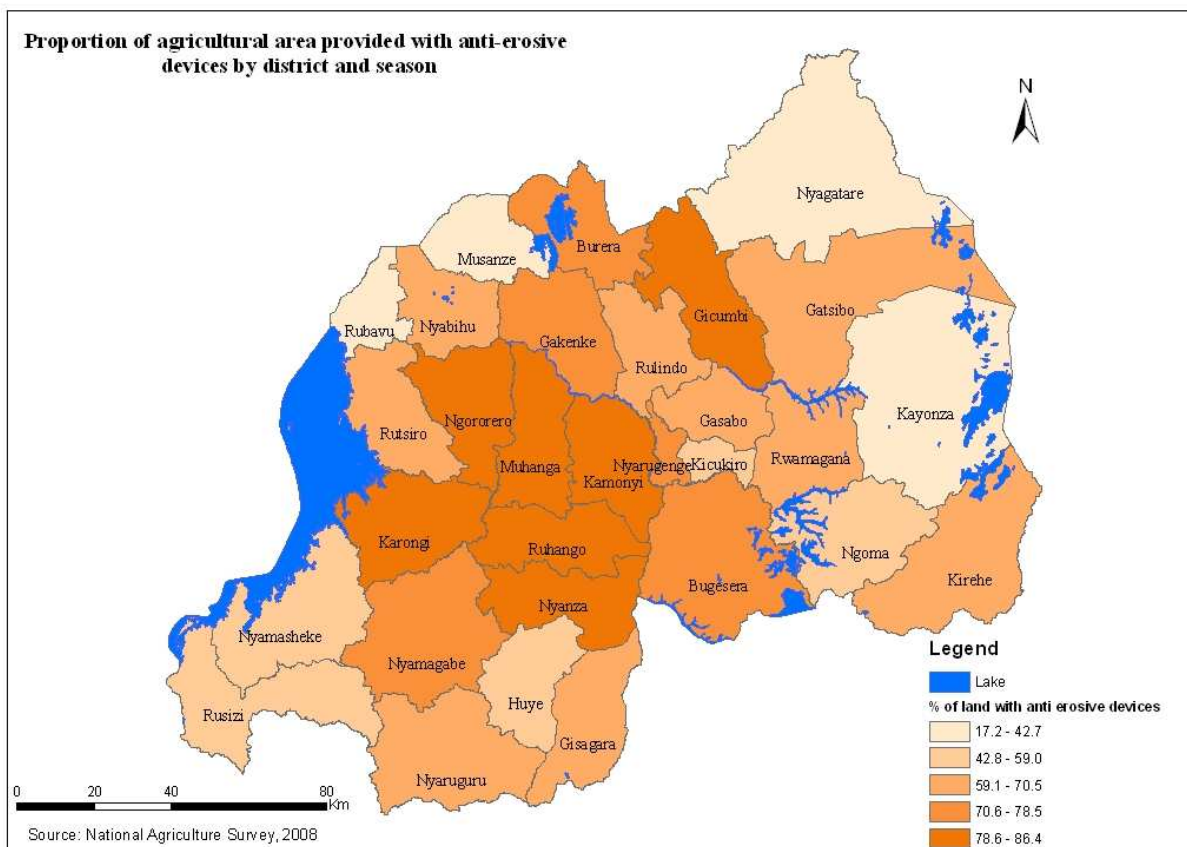

Table 4.2.4. Area of farmlands according to anti-erosive methods used

Anti-erosive device	Area in Ha	Percentage
Area with anti-erosive device, among which :	797 216	62.2%
<i>Radical terraces</i>	33 399	4.2%
<i>Anti-erosive ditches</i>	551 610	69.2%
<i>Anti-erosive hedges</i>	212 207	26.6%
Area without anti-erosive device	483 534	37.8%
<b>Total agricultural area</b>	<b>1 280 750</b>	<b>100.0%</b>

d) *An important part of the area of farms is on hills and near houses.*

The tables 4.2.6 and 4.2.5 below show that 82% of the area of farms is on hills (on top, sides and bottom of the hill) and that the most important part was easily accessible to farmers (about 87% of the area of the farms was accessible within 30 minutes).

Table 4.2.5. Proportion (%) of farmland area according to the time used (in min) from the house

<b>Time (in min) To get to the farmland</b>	<b>Percentage</b>
0 – 15	73.0%
16 – 30	13.9%
31 – 45	4.5%
46 – 60	4.3%
61 & more	4.1%
<b>Total</b>	<b>100.0%</b>

Table 4.2.6. Proportion (%) of farmland area according to their topographic position

<b>Position</b>	<b>Percentage</b>
Top of the hill	24,3%
Side of the hill	45,8%
Bottom of the hill	12,0%
Plain	15,8%
Marsh	2,2%
<b>Total</b>	<b>100,0%</b>

*e) Mostly pluvial traditional crops are cultivated on the quasi-totality of farmlands.*

The table 4.2.7 below is clearly indicating that most of lands were supplied with water from rainfall (more than 95% of the farm area). It was indeed difficult to practice irrigation, drainage or watering on lands situated on hills. Moreover, the cultivation techniques used were exclusively traditional. The mechanized cultivation was non-existent at the level of agricultural households in Rwanda (see table 4.2.8).

Food and cash crops are covering about 71% of total farm area. The remaining area is covered by forage, pasture, uncultivated land, forestation, etc. see Chart 4.2.2 and table 4.2.9 below.

Table 4.2.7. Proportion (%) of farmland area according to the main mean of water supply

Method of water supply to crops <sup>5</sup>	Percentage
Rain	98.0%
Irrigation	0.6%

<b>Total</b>	<b>1 280 751</b>	<b>100.0%</b>

<sup>5</sup> This concerns the season 2008A.

### 4.3. Agricultural practices and crop production

#### 4.3.1. Cultivated crops during the agricultural year 2008

The tables 4.2.3a and 4.2.3b below present the crops that the agricultural households planted during the year 2008 by season. Those tables show that Rwanda grows a range of varieties of agricultural crops. The major ones are the following: maize and sorghum for cereals, sweet potatoes, cassava (soft and bitter), taro and potatoes for roots and tubers, beans and the peas for pulses, soya beans and groundnuts for oil crops, vegetables dodo, gourds, eggplants, onions and cabbages for vegetables, bananas (for cooking, beer and fruits) and avocados for fruits, etc.

Table 4.3.1a. Distribution of agricultural households according to the crops planted during the season 2008A by provinces

#### 4.3.2. Practices of horticulture

An in-depth analysis of the practice of horticulture revealed that, in 2008, only 50.7% and 41.5% of agricultural households declared to have practiced horticulture, during the seasons A and B respectively. 38% and 32% of households planted vegetables, during the seasons A and B. Fruit trees were planted by 25% and 20% of households during the same seasons. While only 10% and 5% planted ornamental flowers and/or trade flowers (see chart 4.3.1 and table 4.3.2 below). Besides, it has to be noted that in many of the districts, it was usually during the season A that the majority of agricultural households practiced horticulture (see map 4.3.1 below and tables A.4.3.7a and A.4.3.7b in annex).

For farmers who planted fruit trees and/or flowers, seeds were received from different sources, essentially from public and NGO's nurseries (see tables A.4.3.8a and A.3.8b in annex).

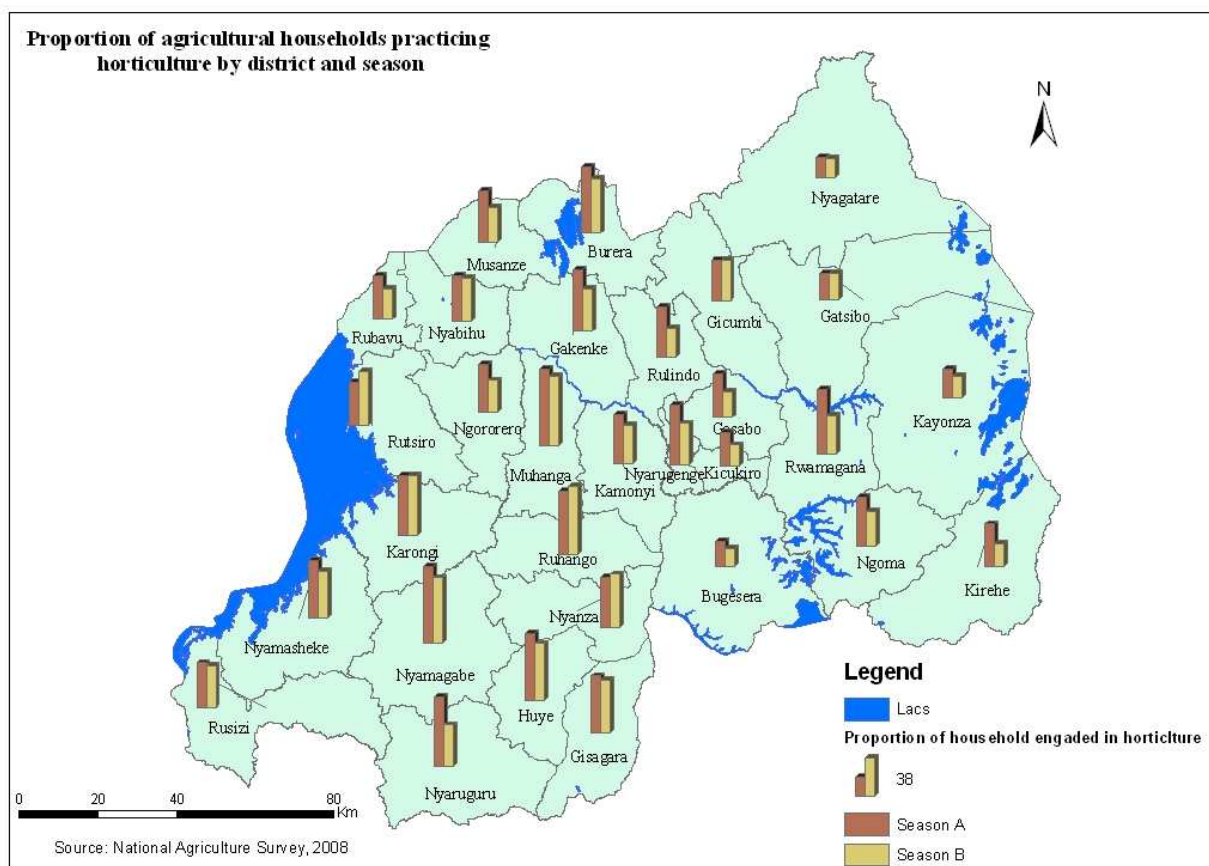

Table 4.3.2. Proportion (%) of agricultural households who have practiced horticulture by season

Types of product	Season 2008A	Season 2008A
Vegetables	38,1%	31,6%
Fruit trees	25,2%	19,6%
Ornamental and/or trade flowers	9,7%	5,1%
<b>Practicing horticulture</b>	<b>50,7%</b>	<b>41,5%</b>

Map 4.3.1. Proportion of agricultural households practicing horticulture by district and season

#### 4.3.3. Use and cost of agricultural inputs

- a) The use of improved seeds and pesticides/fungicides is still low; on the other hand, the fertilizers, and especially the organic fertilizers, are of a common use for many of farmers.*

The chart 4.3.2 and table 4.3.3 below (see also the tables A.4.3.1a and A.4.3.1b in annex) point out clearly the level of agricultural inputs used by type of inputs: that of improved seeds, pesticides/fungicides and fertilizers, among which organic fertilizers (manure of big and small animals and compost) and chemical. They show, indeed, that the use of improved seeds and pesticides/fungicides was not popularized enough in 2008: only 13% and 7% of agricultural households declared having used improved seeds during the seasons A et B, respectively. While the pesticides/fungicides were used by 16% et 14% of agricultural households during the same seasons.

With regards to the fertilizers, they were used, in association or otherwise, by 75% and 62% during the season A and B respectively. The most popular ones were organic fertilizers (manure of big and small animals and compost): they were in use in 38-41% and 23-33% of agricultural households during the first and second seasons respectively. Concerning the chemical fertilizers, only 18% and 14% of households had access to their use during the same seasons (respectively).

Table 4.3.3. Distribution of agricultural households who have used agricultural inputs by season

	Season A		Season B	
	Number	%	Number	%
Improved seeds	222 530	13.3%	119 619	7.1%
Pesticides/fungicides	262 159	15.7%	236 933	14.2%
One or another fertilizer, among which:	1 262 372	75.4%	1 033 268	61.7%
Manure of big animals	681 630	40.7%	557 082	33.3%
Manure of small animals	639 785	38.2%	439 906	26.3%
Compost	640 589	38.3%	391 685	23.4%
Chemical fertilizers	297 191	17.7%	229 421	13.7%

*b) The agricultural inputs that are mostly purchased by farmers are traditional seeds, agricultural equipments and agricultural manpower.*

Irrespective of season, in 2008 the agricultural inputs purchased by most of farmers were traditional seeds (between 60-75% of agricultural households, every season), agricultural equipments (between 51-68% of agricultural households, every season) and agricultural manpower (between 50-52% of agricultural households, every season). With regards to pesticides products, between 20-26% of agricultural households were purchasing them every season. Those who were able to buy improved seeds and fertilizers (chemical and organic) were only between 7-15% of all agricultural households (see chart 4.3.3, tables 4.3.4a and 4.3.4b below and tables from A.4.3.2a1 to A.4.3.2b2 in annex).

**Chart 4.3.3. Agricultural households who have purchased agricultural inputs by season**

*c) Of all the expenditures in agricultural inputs, it was the cost of the agricultural manpower that is the most expensive for farmers.*

The 2008 NAS 2008 revealed that the cost of the agricultural manpower is heavier than other expenditures engaged for agricultural inputs (see chart 4.3.4. above). The former represents, indeed, 40% of all the expenditures engaged for agricultural inputs. It was followed by that of traditional seeds (26%), chemical fertilizers (12%), mainly with the predominance of NPK (about 70% of expenditures for chemical fertilizers), Agricultural equipments (11%), Pesticides products (7%), but mainly the Dithane (about 70% expenditures for Pesticides products) and improved seeds (2%).

The chart 4.3.5, shows the variability of input expenditures by season. It shows that the seasons A and B cost, respectively, 52% and 48% of the annual input expenditures. The cost of manpower did not vary so much from one season to another. However, the expenditures that varied significantly (between the two seasons A and B) were organic fertilizers and pesticide products (respectively from 63-37% to 38-62%), improved seeds and agricultural equipments (respectively from 59-41% to 58-42%), traditional seeds and chemical fertilizers (from 56-44% to 43-57%).

Maps 4.3.2 and 4.3.3 below point out the variability of the total expenditures at district level as well as between seasons within the same district. On the other hand, the tables from 4.3.5a to 4.3.5c below and the related ones presented in annex (tables from A 4.3.1a1 to A 4.3.1c2) show the same facts, between the components of expenditures and seasons.

#### **4.3.2. Crop production**

The crop production recorded during the agricultural year 2008 is presented in details (by product, season and annual total) in table 4.3.7 below. Similar data disaggregated by province and district are also presented in the annex (see tables from A 4.3.6a to A 4.3.6c). From the quantities produced (in tons), their nutritional equivalent was estimated, in calories, proteins and fats (see table 4.3.6 and chart 4.3.6 below). It appears, from there, that it is the root crop production that contributed the most to the food basket of vegetal products of a Rwandan person, with 869 calories/person/day (44,8% of the total calories from vegetal source). It is followed by that of fruits (378 Cal/per/day), pulses (335 Cal/per/day) and cereals (260 Cal/per/day), that contribute, respectively, for 19.4%, 17.2% and 13.4% of the total calories from vegetal source.

All other product groups (oil crops, vegetables, sugar, stimulants and spices) represent not more than 5.2% of total caloric energy, that is 100 Cal/per/day (see chart 4.3.4 below). All those product groups constitute a total of 1942 Cal/per/day, 49 Prot/per/day (in Grs) et 14 Fat/per/day (in Grs). This level of nutritional provisions is in line with FAO estimates through its Food Balance Sheets for in 2003, in which it is established that the food availability from vegetal source was evaluated at 2005 Cal/pr/day, 43 Prot/per/day et 10 Fat/per/day. Indeed, the products considered here were mainly for domestic consumption and constitute its bulk proportion (without taking into consideration other possible external food provisions, in this case from imports).

Among the crop production, some quantities are intended for sale and constituted a source for monetary income for agricultural households. For example, during the agricultural year 2008, some product groups were sold in the following proportions: fruits for 52%, cereals for about 48%, vegetables for about 40%, roots and tubers for 30%, oil crops for 13% and pulses for about 9% (see table 4.3.8).

## 4.4. Livestock practices and production

a) 70% of agricultural households in Rwanda are at the same time breeders.

From the 2008 NAS, it was noted that 70% of agricultural households are at the same time breeders, of which 22.9% kept small animals, 31% kept big animals with or without small animal and poultry, 16.9% kept poultry with or without small or big animals (see table 4.4.1 and chart 4.4.1. below). Therefore to arrive at the target recommended by the EDPRS, that proportion of households keeping at least one type of livestock should reach the point of 85% by 2012.

Table 4.4.1. Distribution of agricultural households according to the type of livestock owned

**Chart 4.4.1 Proportion of breeders agricultural households**

*b) The system of breeding cattle in stalling sees significant progress in Rwanda.*

The table 4.4.2 below shows that the number of agricultural households who are at the same time breeders of cattle was estimated at 581516 (50% of total breeders households) in 2008. The most practiced breeding technique was stalling (78% of cases). Together with those who practiced the mode semi stalling, they constituted 88% of cases. The breeding of animals on hills or in pastures was seldom practiced in Rwanda (only 8% of cases). This situation may be explained by the formal ban on cattle wandering, by an imposition of a fine to whoever violates this law. It is also important to note (from the table 4.4.3 below) that most breeders of cattle possess cowsheds (88.7% of cases).

In the same table 4.4.2, one notes that those breeders households usually feed their animals with fodder found on anti- erosive hedges (42.6% of cases), or glean fodder in bushes (27.1%), or on fodder land (19.1% of cases). In few cases, the animal feed is found from Scattered stalks of fodder, grazing, or purchased (respectively in 7.1%, 0.9% and 4.2% of cases).

Besides, from the table 4.4.4., it is shown that only 33% of agricultural households owned fodder land. Nevertheless, even for those who had some land, most of them (83%) are on very small areas, of not more than 500 m<sup>2</sup> each.

Related additional information disaggregated by province and district can be found in tables A.4.4.2 and A.4.4.3 in annex.

Table 4.4.2. Distribution of agricultural households who are cattle breeders according to livestock practices and the main source for animal feeding

*c) The structure of the herd of animals is varied in Rwanda.*

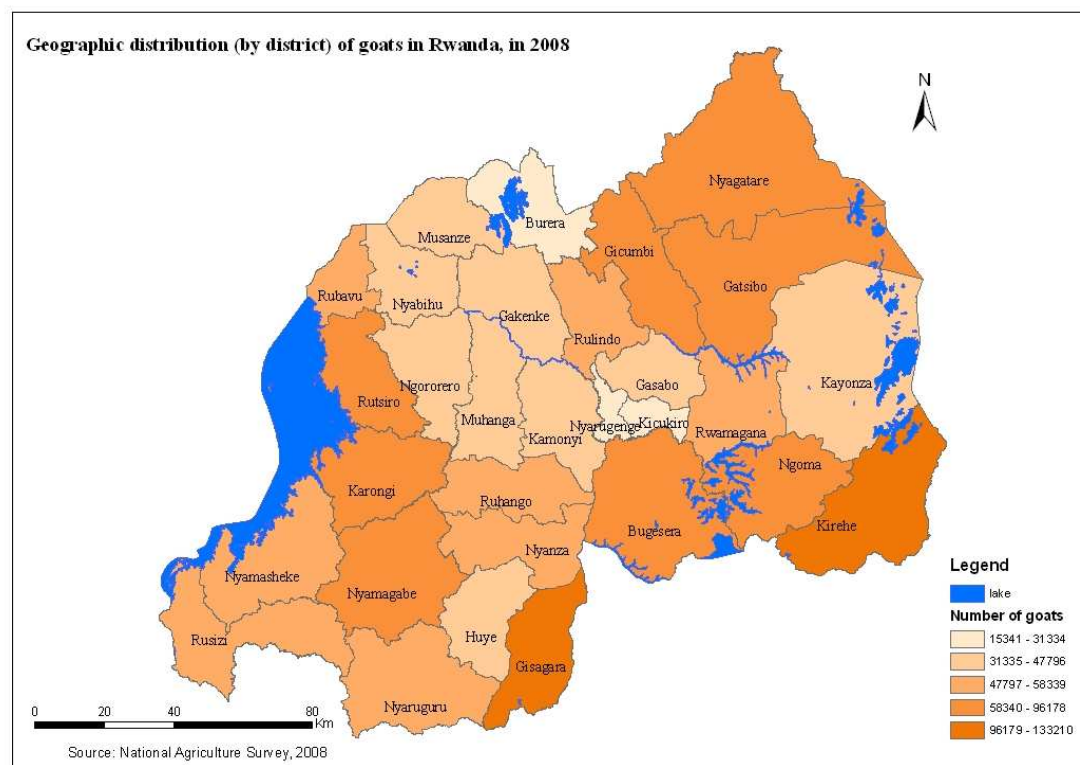

The tables 4.4.5 and 4.4.6 below show that the composition of herd of animals in Rwanda varied. Indeed, in 2008, Rwanda counted 1,548,521 cattle, 1,736,211 goats, 323,003 sheep, 310,833 pigs, 1,026,440 chickens, 134,645 other poultry, 474,512 rabbits and 292,118 guinea pigs. The maps from 4.4.1 to 4.4.6 show, from their side, the distribution of animals by district and display the geographical zones with high or low predominance of every type.

The table 4.4.7 presents the number of births and deaths of livestock as recorded every season. From that table, it appears that during the agricultural year 2008, there no seasonal effect on animal births and deaths.

*d) The milk and egg production is mostly recorded during the season B.*

From the chart 4.4.2 and the table 4.4.8 below, it is shown that the agricultural period that is most favorable for cow milk and hen egg production is the season B. The contribution of cow milk and hen egg productions of the season 2008B in the annual total production was of 61% and 58% respectively. This is explained by the fact that it is during that season that the pasture is more abundant. For the egg production, it is also higher in the same season because it is during that period that chickens have more freedom to move (can therefore feed themselves easily), since they are not confined in the house. In fact, during the season A, they are kept confined to avoid that they damage the crops that are still growing (especially beans).

**Chart 4.4.2. Proportion of the milk and eggs production by season**

**Table 4.4.8. Livestock production (in quantity) by item and season**

Production (quantity and number)	Season 2008A	Season 2008B	Year 2008

## 4.5. Fishery, aquaculture and beekeeping practices and production

### 4.5.1. The aquaculture, fishery and beekeeping activities are not very developed in Rwanda.

It appears from the table 4.5.1 that aquaculture, fishery and beekeeping activities were not very developed in Rwanda, as of 2008. Few agricultural households declared having fish ponds or engaged in fishery activities. Moreover, only 4% of farmers practiced beekeeping. For more details (date by province and district), to refer to tables from A4.5.1 to A4.5.5c that are presented in the annex.

The table 4.5.2. shows the production and income level obtained from aquaculture and fishery activities (see also the chart 4.5.1). It emerges that the annual total production of fish amounted to about 3100 Tons, providing to the farmers an income to the tune of about 973 millions RWF. The Western province contributed the most to the bulk (77%) of the total income obtained from that sector. It is followed by the Eastern province (13%), and the Northern province (7%), the remaining part of the country contributing only for 3%.

The table 4.5.3 and the chart 4.5.2 show the level of honey production. The former amounted to about 3500 Tons. The Southern province produced the biggest part (41%), followed by the Western (28%), the Northern (19%) and Eastern (11%). Kigali City produces only 1%.

Table 4.5.1. Distribution of agricultural households according to the practice or not of aquaculture, fishery and beekeeping

Fishery, aquaculture and beekeeping practices	Yes		No

## 4.6. Forestry practices and income

### 4.6.1. Forestry practices

a) *About a third of agricultural households do not have trees in their farms.*

From the chart 4.6.1 and the table 4.6.1, it appears that 28.3% of *agricultural households* in Rwanda had no trees in their farms, as of 2008. Those who owned trees and afforestations were 42.9%. The others (28.8%) had scattered trees on their farms.

The map 4.6.1 below and the table A.4.6.1 in annex show that it is in the East province where important proportions of households without trees live.

Map 4.6.1. Proportion of agricultural households having afforestations or scattered trees on the holding, in 2008

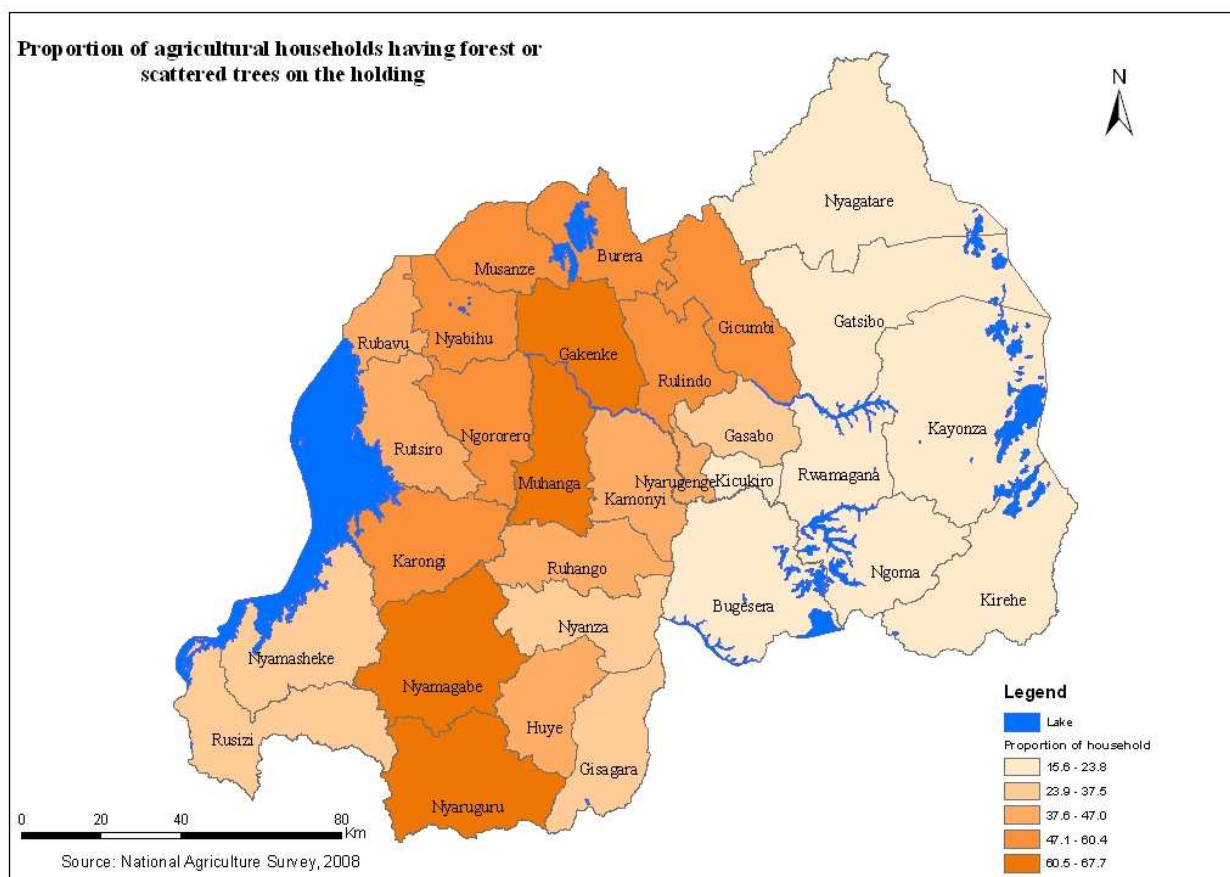

Table 4.6.1. Distribution of agricultural households according to the presence or not of trees on the holding

Existence of trees and/or afforestations	Number	Percentages
Afforestation+Scattered trees	575 603	34.4%
Only afforestation on the farm	142 957	8.5%
Only scattered trees	482 243	28.8%
No afforestation, no scattered trees	473 884	28.3%
<b>Total</b>	<b>1 674 687</b>	<b>100.0%</b>

*b) The afforestations of agricultural households constitute their main wooden source for cooking*

The table 4.6.2 below shows that the afforestation of agricultural households constituted their main source of firewood for cooking. Those households with no or not enough afforestations had to glean some wood in the public afforestations or in the neighboring ones, to buy firewood or rely on crop residues.

Table 4.6.2. Distribution of agricultural households according to the presence of afforestations and source of firewood for cooking

Main source of the firewood	Existence of trees on the farm (afforestation or not) ?									
	Afforestation+Scattered trees		Only afforestation on the farm		Only scattered trees		No afforestation, no scattered trees		Total	
Household afforestation	407 873	24.4%	92 220	5.5%	10 368	0.6%	0	0.0%	510 460	30.5%
Glean firewood in public afforestations	25 707	1.5%	7 345	0.4%	71 897	4.3%	66 280	4.0%	171 229	10.2%
Glean firewood in afforestations of neighbors	68 372	4.1%	16 128	1.0%	186 723	11.1%	192 142	11.5%	463 366	27.7%
Use crop residues for cooking	15 209	0.9%	5 379	0.3%	65 323	3.9%	86 609	5.2%	172 519	10.3%
Buy firewood	44 094	2.6%	15 767	0.9%	87 153	5.2%	82 482	4.9%	229 495	13.7%
Other	14 348	0.9%	6 118	0.4%	60 780	3.6%	46 370	2.8%	127 617	7.6%
<b>Total</b>	<b>575 603</b>	<b>34.4%</b>	<b>142 957</b>	<b>8.5%</b>	<b>482 243</b>	<b>28.8%</b>	<b>473 884</b>	<b>28.3%</b>	<b>1 674 687</b>	<b>100.0%</b>

c) *The level of domestic reforestation is still low in Rwanda.*

Despite the relatively high proportion of households without trees, the enthusiasm for domestic reforestation was not significant as of 2008. Indeed, the table 4.6.3 shows that only 22.9% and 11.7% of agricultural households planted new trees during the seasons 2008A and 2008B, respectively. And from the tables A4.6.2a and A4.6.2b in the annex, it is clear that new plants are from different sources, the main one being public tree nurseries.

Table 4.6.3 Distribution of agricultural households according to that they recently planted trees or not and the number of trees planted by season

	Have recently planted trees						Total number of trees recently planted
	Yes		No		Total

#### 4.6.2. Income generated from forestry activities

a) *The average income generated from forestry activities was about 6800 RWF per household in 2008.*

The table 4.6.3 below shows that in 2008, the total annual income generated by forestry products rose to about RWF 4.9 billion, which constitute an average of about 6800 RWF per household with afforestations (the total number of households with trees was estimated at 718 560)<sup>6</sup>.

<sup>6</sup> It has to be noted that, in order to avoid biased result, the calculation of this average does not include households who have scattered trees only.

*b) The income generated by the forestry activity is varied.*

From the chart 4.6.2 (as well as from the table 4.6.3) below, it is shown that the forestry products that generated income are the following: timber for construction, charcoal, sawn wood as well as firewood. The timber for construction contributed 35% to the total income from forestry. It is followed by the charcoal income (24%), the sawn wood (23%) and firewood (18%).

## 4.7. Food stocks and nutrition of agricultural households

### 4.7.1. *The most food crops in stock are sorghum, dry beans and maize.*

The products that were subject to questions on food storage are cereals (sorghum, maize, wheat and rice), pulses (beans and peas) as well as oil crops (groundnuts and soybeans). Tables A.4.7.1a and A.4.7.1b in annex show that the products that were most in stock (in 2008) were sorghum, dry beans and maize.

### 4.7.2. *Nutrition and food of agricultural households*

During the 2008 NAS, agricultural households were interviewed about their food and nutrition. From the information obtained, the following can be noted:

- a) On average, a Rwandan adult living in an agricultural area eats two meals a day and, generally, consumes his own products.*

During the agricultural year 2008, adult persons of the agricultural sector had, on average, two meals per day. 88.9% of agricultural households declared having access to, at least, 2 meals a day, of which 82.3% declared two meals and 6.6% declared three meals, while those who were able to get only one meal a day represented about 11.1% (see table 4.7.1 below and tables A.4.7.1a and A.4.7.1b in annex).

The most popular meals (the most consumed ones) in the agricultural area were composed of beans (on average 5 times a week), vegetables, sweet potatoes and vegetal or animal oil (on average 3 times a week, each). Cassava, potatoes and cooking banana were consumed two times a week, on average (see tables from A.4.7.2a to A.4.7.3b in annex).

With the exception of vegetal or animal products, the rest of food items, as well as fruits, were produced by the population itself and self-consumed. Other products consumed by agricultural households but usually purchased are: rice, fish, meat, vegetal oil, sugar, , etc. (see tables A.4.7.4a and A.4.7.4b in annex).

Table 4.7.1. Distribution of agricultural households according to the daily number of meal of adults by season

Number of meals per day	Season 2008A	Season 2008B
One (1) meal	11.1%	9.8%
Two (2) meals	82.3%	82.1%
Three (3) meals & more	6.6%	7.1%
<b>Total</b>	<b>100.0%</b>	<b>100.0%</b>

- b) Nearly half of the agricultural households declared to have experienced problems of food self-sufficiency (lack of enough food or damaged food) during the last six months preceding the interview.*

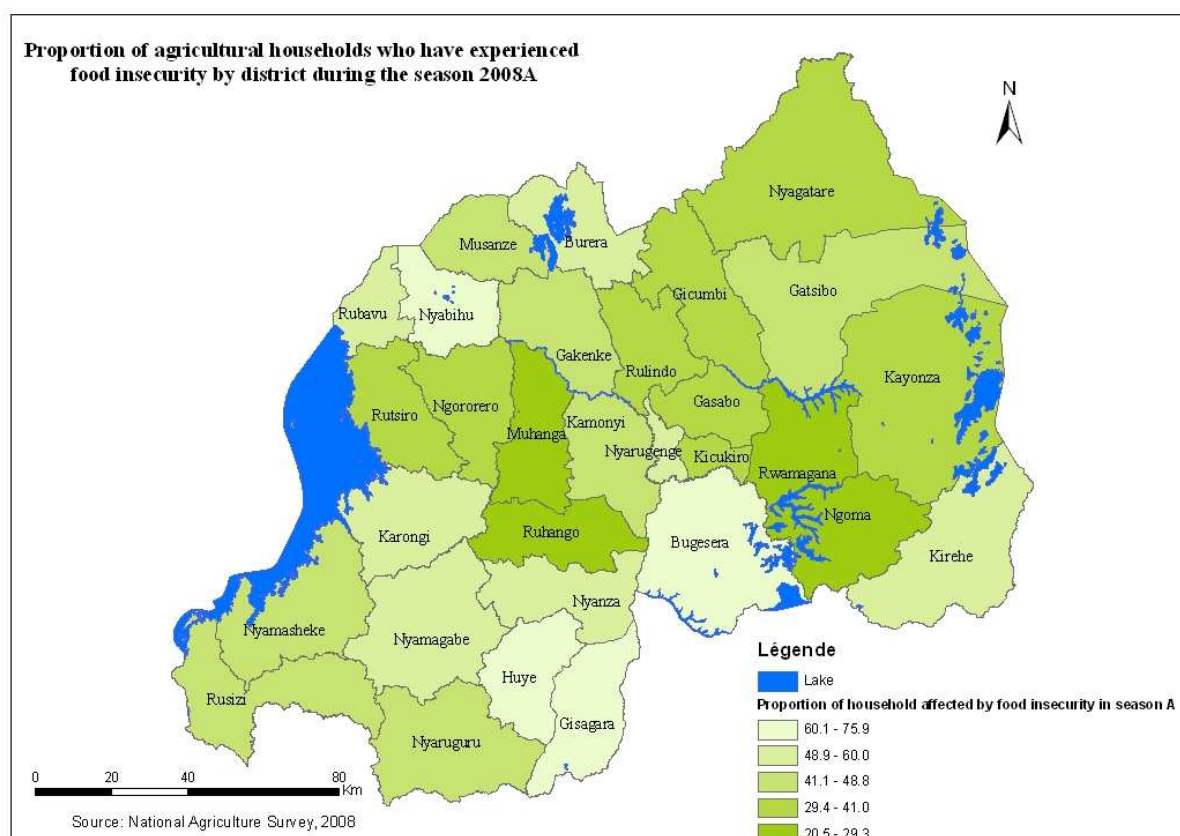

During the agricultural year 2008, 47.1% and 27.9% of agricultural households (respectively in seasons A and B) declared to have experienced problems of food self-sufficiency (lack of enough food or damaged food) during the last six months preceding each of the phase of the survey.

The same information is disaggregated by province and district and is presented in maps from 4.7.1 to 4.7.3 as well as in tables A.4.7.5a and A4.7.5b of the annex.

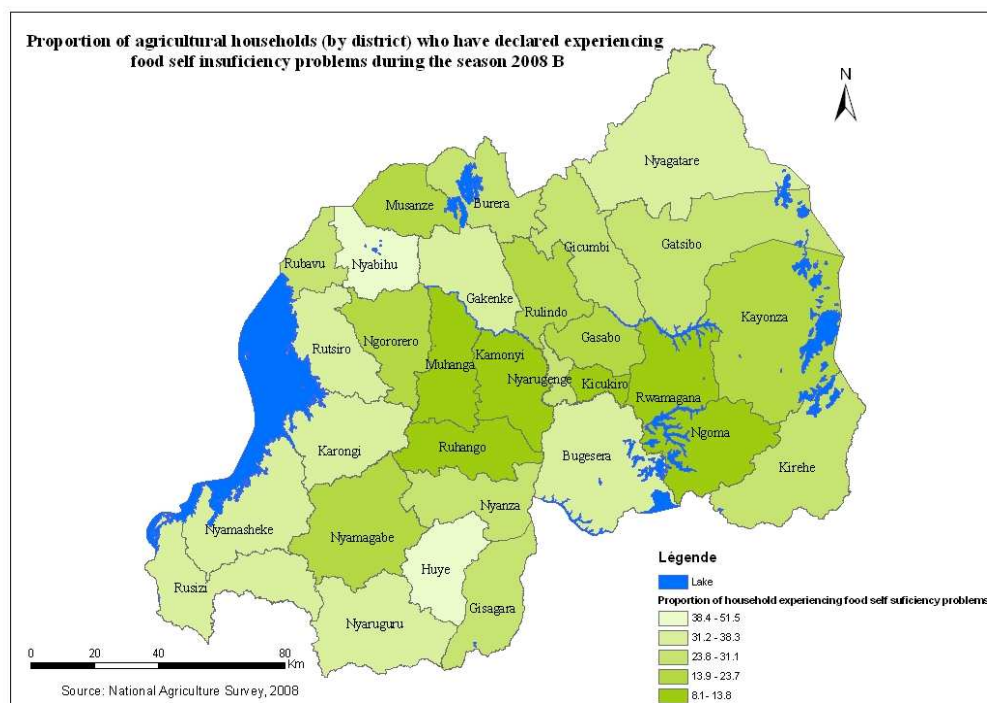

The households which declared to have had food self-sufficiency problems were also asked to mention the causes as well as the reason why they faced it. The results obtained are presented in the annex, through the tables from A.4.7.5a to A.4.7.7b. From there, one notes that among the causes of food self-sufficiency problems quoted by most of the households there are mainly: drought/irregular rain, unusual high food prices, unusual high level of human diseases and unusual high cost of agricultural inputs (seeds and fertilizers).

To address those problems, affected households had to limit their feeding to basic and inexpensive food items; the food ratio and/or the number of meals a day was also reviewed downwards; some of them had recourse to their savings and/or to the financial credit, to the sale of their livestock or to overtime work.

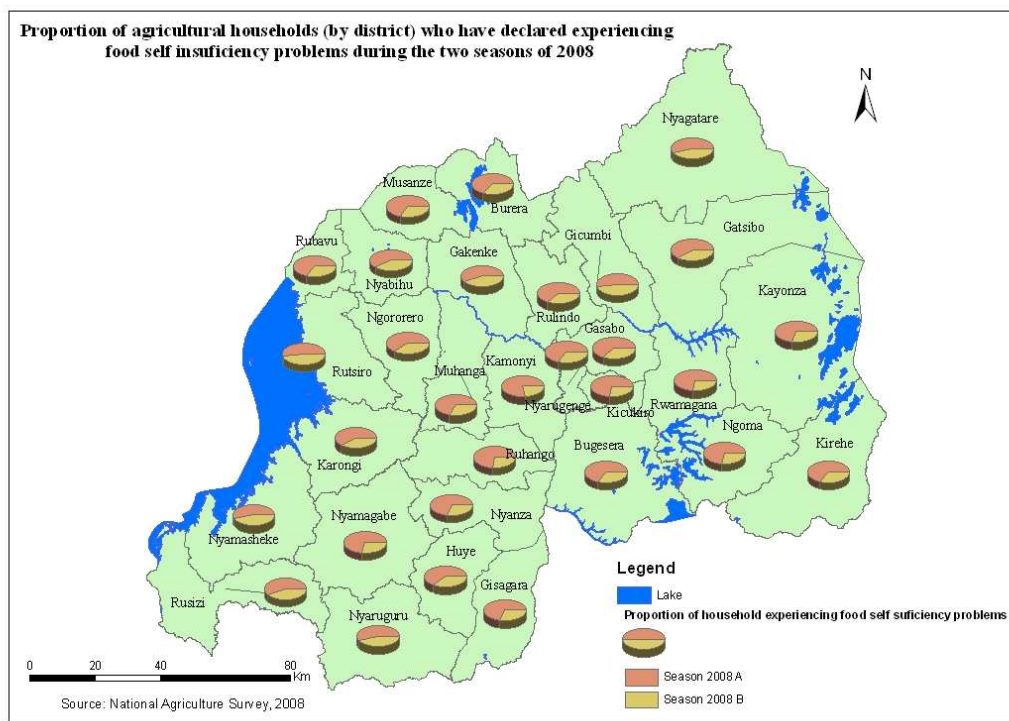

Map 4.7.1. Proportion of agricultural households (by district) who have declared experiencing food self-sufficiency problems during the season 2008A

Map 4.7.2. Proportion of agricultural households (by district) who have declared experiencing food self-sufficiency problems during the season 2008B

Map 4.7.3 Proportion of agricultural households (by district) who have declared experiencing food self-sufficiency problems during the two seasons of 2008

- c) *From the beginning to the end of the survey period most of agricultural households were not able to improve their food self-sufficiency.*

At the end of each season of 2008, it was asked to each household whether they reached their food self-sufficiency. According to the chart 4.7.1 below, and with regards to the food self-sufficiency, it appears that the progress accomplished between the beginning and the end of each agricultural season of 2008 were not significant. Indeed, only 15% and 10% of agricultural households declared having reached their level of food self-sufficiency, respectively by the end of the season A and B. 57% and 49% said that the level reached was not very satisfactory. The details of that information (by province and district) is presented in annex, through the tables A.4.7.8a and A.4.7.8b.

**Chart 4.7.1. Proportion (%) of agricultural households according to their perception about the level of food self-sufficiency reached by the end of each agricultural season of 2008**

- d) *The entire level of nutritional equivalent of the total domestic agricultural production is dominated by vegetal products.*

This survey allowed obtaining information on quantities of crop, milk, eggs, honey and fishery productions. In the absence of data on meat production, this element was estimated based on the following parameters: number of live animals, take-of-rates and carcass weight. Slaughtered animal numbers were obtained by applying the take-of-rate to life animal numbers; the meat production was deducted by applying the carcass weight to slaughtered numbers.

This exercise allowed to evaluate the nutritional equivalent of the total domestic agricultural production (of crops, livestock<sup>7</sup> and fishery). The result is summarized through the chart 4.7.2 and the table 4.7.2

<sup>7</sup> Offals and animal fats are not included. But, their contribution is considered as insignificant.

below. From there, one notes that the domestic agricultural production of 2008 was equivalent to 1979 Cal/per/day, 52 Prot/per/day (en Grs) and 30 de Fat/per/day (en Grs). 98% and 2% of caloric contributions are respectively from vegetal and animal products. Knowing that the part corresponding to human food is a component of the balance between the domestic supply and domestic consumption, these results provide a pertinent information for evaluating the food security level of the country.

**Chart 4.7.2. Calorific composition of crop, livestock and fishery production**

Table 4.7.2. Global nutritional equivalent from vegetal (crops) and animal (livestock and fishery) products

	Cal/per/day	Prot/per/day Grs	Fat/per/day Grs	% Cal
Vegetal products	1942	49	14	98,11%
Animal products	37	3	15	1,89%
<b>Total</b>	<b>1979</b>	<b>52</b>	<b>30</b>	<b>100,00%</b>

## CHAPTER 5 – CONCLUSIONS

A national agricultural survey is a big and challenging operation. It normally covers the whole agricultural year. Its implementation requires mobilization of a sizeable number of field staff who must remain perceptive, consistent, patient and courageous during the whole period of the survey. Indeed, not only do the field staff meet with all the sample households, they also need to travel to the farm/field, crossing mountains and valleys in the country of "thousand hills" like Rwanda. Moreover, this operation has mobilized sizeable financial, logistics and material resources. All that could not be achieved without constraints.

By the end of this operation, it is therefore imperative to undertake an auto-evaluation and answer the following questions. Firstly, what problems and difficulties were met and what lessons have been learnt? Secondly, did the operation actually respond to expectations and objectives? Lastly, on the basis of all lessons learnt and experience gained, what perspectives should be considered for a better utilization of the 2008 NAS output in order to build a foundation for a sustainable development of the agricultural statistics system in Rwanda? It is by responding to all those questions that we conclude this report.

### 5.1. What lessons learnt with the implementation of the 2008 NAS?

The administrative restructuring initiated in 2006, with the decentralization that considers the district as the social and economic development engine, constitutes a new framework for the production of statistics. Moreover, the agricultural sector is so complex that to capture it correctly through the implementation of a large national survey constitutes, in itself, a big challenge for a young institution like the National Institute of Statistics of Rwanda.

Along the whole process of the execution of planned activities, several constraints were met. Fortunately, appropriate solutions were found to address those constraints, and the experience gained in addition to the lessons learnt will contribute to improve agricultural data collection activities in the future. Major lessons learnt and resulting recommendations can be summarized as follows :

- The weak institutional capacities, at all levels (MINAGRI, NISR, Districts), in terms of professional experience in the domain of agricultural statistics needs too be strengthened ;
- The necessity of an active, continuous and sustainable partnership between producers and users of agricultural statistics must prevail at all levels;
- The testing of data collection and processing instruments, from the start to the end of the process, should be undertaken well in advance in order to anticipate and avoid any difficulty that may affect the good sequence of the activities and, as a result, the quality of data to be obtained;
- A special attention must be paid in the selection and training of field staff so that they are well equipped to fulfill their responsibilities;
- The supervision of field work, the good verification and correct codification of the collected data should receive continuous attention in order to minimize non sampling errors;

- The required funds for the execution of the operation, from the start to the end (until the step of the dissemination of the results), should be secured well in advance;
- The overall management of the survey should be adapted to the complexity of the task so that the calendar activity is not negatively affected.

## **5.2. The objectives previously fixed through the ENA 2008 were they reached?**

Despite all difficulties met, one can note that the execution of the NAS responded to expectations. This is justified by the following outputs:

- After the large agricultural survey conducted in 1983, the 2008 NAS was the only national survey to cover a large sample of 10,080 agricultural households.
- In addition, it is the very first time that the country has disaggregated data up to the level of districts. Indeed, even for the survey of 1983, statistics were disaggregated only to level of the 10 then prefectures of the country.
- It is also important to note that the domain covered by the 2008 NAS was the largest ever at all levels. Indeed, not only information on crops and livestock was collected, but also that on aquaculture and fishery, beekeeping and forestry. All agricultural products that are currently grown in the country were covered, including new crops recently introduced in the country. Further extension has been operated by collecting data on horticulture. The nutrition and food also constituted a new domain/theme of study.
- The consequence of all of this is that the country now has a voluminous set of information on the agricultural sector.
- Through the 2008 NAS, the country has gained updated agricultural data in quantity and in quality. Firstly, because an important effort has been done to produce reliable and comprehensive data that are representative at national, provincial and district level. Secondly, because at that time the data sources were incoherent due to differences in methodologies applied. The 2008 NAS results constitute the required reference for main agricultural information for this period. Lastly, the concepts and definitions used corresponded to the international standards. Therefore, the obtained statistics are comparable to those of other countries in the region.
- The 2008 NAS has produced updates to some indicators used in the monitoring and evaluation of the poverty reduction policy and development programs initiated in the framework of the Vision 2020 as well as for the monitoring of the achievement of the Millennium Development Goals (MDG), with regards to the agricultural sector. The tables 5.2.1 and 5.2.2 below show the type of indicators and targets considered in that framework as well as their related correspondents, as obtained from the 2008 NAS.

Table 5.2.1. 2008 NAS response to target indicators of 2020 Vision 2020 and Millennium Development Goals (MDG)<sup>8</sup>

MDG	Indicator	Reference		Target Vision 2020		Target ODM 2020	2008 NAS Results	
		2000	2006/07	2010	2020		Indicator	Observation
MDG 1: Reduction of extreme poverty and hunger	1. Agricultural production (Cal//pers/day)		1878	2000	2200		1979	
	2. Proteins/per/day	44		55	65	22	52	in Grs.
	3. Agricultural population (%)	90		75	50		84	
	4. Land under modernized agriculture (%) <sup>9</sup>	3		20	50		0	For agricultural households only
MDG 7: To ensure a sustainable environment	1. Land protected against soil erosion (%)	20		80	100		66,2	Area with anti-erosive device

Table 5.2.2. The 2008 NAS response to target indicators of EDPRS<sup>10</sup>

Priority domain	Indicator	Reference 2006	Target 2012	2008 NAS result	
				Indicator	Observation
Growth and poverty reduction	1. Employment in agriculture (% of those who consider it as their main activity)	80	70	75,5	This does not include farmers and agricultural family help
Increase of agricultural productivity and food security	2. % of agricultural land protected against soil erosion	40	100	66,2	Area with anti-erosive device
	3. Rural households practicing livestock (%)	71	85	70	

<sup>8</sup> The source of target and reference indicators is the 2020 Vision of Rwanda.<sup>9</sup> This indicator is not part of the MDG's.<sup>10</sup> The source of target and reference indicators is the «Stratégie de Développement Economique et de Réduction de la Pauvreté 2008-2012. Septembre 2007».

### **5.3. What perspectives for the after 2008 NAS?**

The 2008 NAS results constitute a voluminous set of statistics on the agricultural sector. This important output has to be well utilized. In addition to this publication, other analyses and studies should be conducted on the basis of data established. Without being restrictive, the most important may be the following;

- An agricultural map of Rwanda;
- Agricultural profiles of provinces and districts;
- Supply Utilization Accounts and Food Balance Sheets;
- Small agricultural surveys (in this case production surveys) can be undertaken using a sub-sample of that of 2008 and therefore complete some of the 2008 NAS results for instance the planted and harvested area and the yield.

## **ANNEXES**

## **ANNEX 2 - QUESTIONNAIRE**

FORM 1: Characteristics of members of agricultural household

FORM 2.1: Identification of blocks of the holding

FORM 2.2: Sketch of basic blocks

FORM 2.3: Data of the field

FORM 2.4: List of cultures

FORM 3: Purchase of agricultural inputs

FORM 4.1: Register for daily harvest

FORM 4.2: Summary of monthly record for daily harvest

FORM 5.1: Inventory of livestock

FORM 5.2: Flux and animal production

FORM 6: Squares yield

FORM 7.1: Register for daily fishery products

FORM 7.2: Fishing activities

FORM 8: Activities of beekeeping

FORM 9: Activities of forestry

FORM 10: Activities of horticulture

FORM 11: Storage of harvest

FORM 12: Nutrition and household food

NATIONAL INSTITUTE OF STATISTICS OF RWANDA	<b>NATIONAL AGRICULTURAL SURVEY (NAS 2008)</b> <b>(Agricultural Season A / B 20 ....)</b>  <b>FORM 1: Characteristics of members of agricultural household</b> <i>(To be completed once at the beginning of the survey)</i>	

Province : _____/_____/_____/	Cell : _____/_____/_____/	Date of interview : ____/____/____ FROM ____H____ TO ____H____
District : _____/_____/_____/	N°EA/ ZD : _____/_____/_____/	Name of Enumerator : _____

NATIONAL INSTITUTE OF STATISTICS OF RWANDA	<b>NATIONAL AGRICULTURAL SURVEY (NAS 2008)</b> <b>(Agricultural Season A / B 20 ....)</b>  <b>FORM 2.1: Identification of blocks of the holding</b> <i>(To be completed at the beginning of each season)</i>	

Province : _____ / / /	Village/Umutugudu : _____ / / /	Date and period of fill in: ____/____/____ from ____H____ to ____H____
District : _____ / / /	N°EA/ ZD : _____ / / /	Name of Enumerator : _____
Sector : _____ / / /	Name of agricultural farmer : _____ / / /	Name & Signature of Supervisor:-----
Cell : _____ / / /		Date : ____/____/____

***Note:** Before calling the farmer to accompany you to visit the blocks and fields, it is very important that you bring to declare all its blocks. He may be tempted not to declare the farthest if he realizes he has to take you there. Ask a question like "Could you tell us where are located all the blocks of land that the household currently uses for its agricultural activities, breeding, afforestation and even fallow. Fill at home columns 1, 2, 3 and the other columns should be filled on field.*

Order number	Location of block	Area of block In m <sup>2</sup>	Access time from housing Minutes	Acquisition mode	Crop typology	Cultivation method	Main method of erosion control
	Where is the block located ? (Indication commonly used by household member to orientate)  E.g : Near the enclosure ; in the valley .....			Inheritance =1 Purchase =2 Gift received =3 Free use =4 Sharecropping/rent =5 Voluntary sharing =6 Donated by the State = 7 Other =8	Rainfed crops =1 Irrigated =2 Drainage =3 Watering =4	Traditional method =1 Animal traction =2 Mechanized farming =3	Radical terraces without hedge =1 Radical terraces with hedge =2 Anti-erosion ditches without hedge =3 Anti-erosion ditches without hedge =4 Fence made of wood or grass =5 No anti-erosion device =6

NATIONAL INSTITUTE OF STATISTICS OF RWANDA	<b>NATIONAL AGRICULTURAL SURVEY (NAS 2008)</b> <b>(Agricultural Season A / B 20 ....)</b>  <b>FORM 2.2: Sketch of basic blocks</b> <i>(To be completed 6 weeks after the start of the season)</i>	

Province : _____/_____/_____/_____	Village / Umudugudu: _____/_____/_____	Date and period of fill in: ____/____/____ from ____H____ to ____H____
District : _____/_____/_____/_____	N°EA/ ZD : _____/_____/_____/_____	Name of Enumerator : _____
Sector : _____/_____/_____/_____	Name of agricultural farmer : _____/_____/_____/_____	Name & Signature of Supervisor:-----
Cell : .....		Date : ____/____/____

Sketch the block diagram with the fields inside. Enumerate those fields and mark the names of the crops planted in each one. Keep this sheet until the end of the survey for current season. It will allow you to speak always the same language with the farmer about the number of blocks, their location and the fields inside.

<div>BLOC N°.....</div> <div></div>	<div>BLOC N°.....</div> <div></div>
<div>BLOC N°.....</div> <div></div>	<div>BLOC N°.....</div> <div></div>

NATIONAL INSTITUTE OF STATISTICS OF RWANDA	<b>NATIONAL AGRICULTURAL SURVEY (NAS 2008)</b> <b>(Agricultural Season A / B 20 ....)</b>	
	<b>FORM 2.3: Data of the field</b> <i>(To be completed 6 weeks after the start of the season and whenever necessary)</i>	

*Note :* This form must be filled in each field in the presence of the farmer or of his representative. Any field that is expected for sowing / planting before the end of the season will be revisited after the date of the planting and a new sheet will be filled on this occasion for the crops concerned only.

Province : _____/____/____	N°EA/ ZD : _____/____/____	Date and period of fill in: ____/____ from ____H__ to ____H__
District : _____/____/____	Name of agricultural farmer : _____/____/____	Name of Enumerator : _____
Sector : _____/____/____	Location and N° of block : _____/____/____	Name & Signature of Supervisor:-----
Cell : _____/____/____	N° of field : _____/____/____	Date : ____/____/____

### Characteristics of the field

#### 01. Position

1. On hilltop

2. On hillside

3. On hillfoot

4. In the  
plain

5. On  
marsh

☐

#### 02. Area of the field (Ha)

		.						
--	--	---	--	--	--	--	--	--

#### 03. Main purpose of the field:

1. Food crops

2. Cash crops

3. Forage crops

4. Fallow

5. Uncultivated field/ Pasture

6. Afforestation

7. Other use

☐

Get help from the farmer to fill the following tables. The date will be presented as follows: October 2003 = 10/03. February 1999 = 02/99. See the codes crops at the bottom of the next page.

	Name of crop →	Code of crop →	Put the names of five crops in descending order				
			1	2	3	4	5
04. Date of sowing/planting or starting of fallow/pasture (MONTH/YEAR)							
05. Did the sowing/planting take place during current season? Yes=1 No=2 →09							
06. Quantity of common seed used (In Kg)							
07. Quantity of plants used (Number)							
08. Quantity of improved seed used (In Kg)							
09. Manure of cattle has been implemented. Yes=1. No=2							
10. Manure of small livestock has been implemented? Yes=1. No=2							
11. Manure from toilets has been implemented? Yes=1. No=2							
12. Manure from compost has been implemented? Yes=1. No=2							
13. Green manure has been implemented? Yes=1. No=2							

14. Have you applied mulch on the crop?					
15. Quantity of chemical/mineral fertilizer used (in Kg)					
16. Quantity of pesticides used (in l)					
17. Quantity of pesticides used (in Kg)					
18- Number of time pesticides have been applied					
19. The use of main part of harvest : Household consumption =1. Feed for livestock = 2. Marketing = 3. Other = 4.					
20. Quantity of seeds/plants required for sowing /planting whole field in monoculture (en Kg)					
21. Main water source for the crop: Rains= 1. Irrigation = 2. Drainage = 3. Watering = 4					

Name of crop →	Put the names of five crops to be sowed/planted by the current season				
	1	2	3	4	5
Code of crop →					
22. Scheduled date for sowing (DD/MM)?					

#### Code des cultures

NATIONAL INSTITUTE OF STATISTICS OF RWANDA	<b>NATIONAL AGRICULTURAL SURVEY (NAS 2008)</b> <b>(Agricultural Season A / B 20 ....)</b>  <b>FORM 4.1: Register for daily harvest</b> <i>(To be completed by the operator for each day of harvest)</i>	

Province : _____ / ____ / ____	Cell : _____ / ____ / ____	Date of register deposit (dd /mm/yy) : ____ / ____ / ____
District : _____ / ____ / ____	N°EA/ ZD : _____ / ____ / ____	Name of Enumerator : _____
Sector : _____ / ____ / ____	Name of agricultural farmer : _____ / ____ / ____	Name & Signature of Supervisor:-----
		Date : ____ / ____ / ____

Notes:

Each harvested product must be recorded in the daily register.

Each evening, the farmer controls the entries in the register by asking other members of the farm everything that has been harvested in the fields today.

**Keeping the register:**

At home. in a safe place. The register must be kept in a plastic bag with a pencil and an eraser. Do not take it with you on the field or elsewhere.

Day of harvesting	Date of harvesting	Harvested crop ( Note each crop per line)	Harvested Quantity		Sold Quantity	
			Quantity	Unit of measure Kilo : 1 Litre : 2 Number/ pieces : 3	Quantity	Unit of measure Kilo : 1 Litre : 2 Number/ pieces : 3
1.	2.	3.	4.	5.	6.	
Monday	27/09/20	Banana for	50	1	20	1
Thursday	30/09/20	Irish potato	20	1	0	1
