

# **Final Report on the Field Works 2017 Implemented in the Framework of “A Three–Year (2015–2017) Monitoring of External Migration Situation in Armenia through Sample Survey” Program**

**Ruben Yeganyan, Program Manager**

## **List of Abbreviations**

<b><i>RA</i></b>	<b><i>Republic of Armenia</i></b>
<b><i>HH</i></b>	<b><i>Household</i></b>
<b><i>M</i></b>	<b><i>Migrant</i></b>
<b><i>MM</i></b>	<b><i>Migrant Member (of a household)</i></b>
<b><i>RM</i></b>	<b><i>Returned Migrant</i></b>
<b><i>MA</i></b>	<b><i>Migrant that is Abroad</i></b>
<b><i>PPS</i></b>	<b><i>The Period Prior to the Survey (2014-2017)</i></b>

### **1. The works that have been completed**

The prefield, field and post field works that have been done **in the framework of the “A Three–Year (2015–2017) Monitoring of External Migration Situation in Armenia through Sample Survey” Program in 2017** are the following:

- Editing of survey questionnaires and other instruments,
- Editing of preliminary database,
- Sampling of clusters and the HHs included in the main and the reserve samples that should be surveyed,
- Pilot survey,
- Final editing of survey questionnaires and the instruments based on the results of the pilot survey,
- Multiplying survey questionnaires and other instruments,
- Recruitment, training and instructions for the field staff,
- Field works,
- Intermediate and postsurvey control of field works,
- Proofreading of the filled out survey questionnaires and data entry,
- Data cleansing in the preliminary database,
- Summary of the results of the field works done so far and preparation of a final report.

### **2. The results of the field works**

The field works (surveys of HHs and Ms) started on May 20 and were finished by July 14.

Since May 20 till July 14 the field staff consisting of 5 group leaders and 27 interviewers surveyed all the sampled 140 clusters (see Table 1). All the 71 settlements in the sample population, including 26 cities (one of them is Yerevan) and 45 villages,<sup>1</sup> were surveyed.

Monitoring beyond the field workers' dwelling places was done by automated working subgroups.

**Table 1. Distribution of all the clusters and the surveyed HHs by large administrative territorial unit and type of settlement of the RA**

Administrative territorial unit	Clusters			Surveyed HH								
				Total			HH included in the					
							main Sample			Neighboring HH		
	Total	Urban settlement	Rural settlement	Total	Urban settlement	Rural settlement	Total	Urban settlement	Rural settlement	Total	Urban settlement	Rural settlement
Yerevan	52	52	-	914	914	-	772	772	-	142	142	-
Aragatsotn	6	2	4	110	40	70	90	30	60	20	10	10
Ararat	11	3	8	204	50	154	165	45	120	39	5	34

Tavush	6	3	3	153	70	83	90	45	45	63	25	38
<b>Total</b>	<b>140</b>	<b>95</b>	<b>45</b>	<b>2783</b>	<b>1815</b>	<b>968</b>	<b>2092</b>	<b>1417</b>	<b>675</b>	<b>691</b>	<b>398</b>	<b>293</b>

The Programme Manager and the Senior Expert organized and coordinated the field works through phone calls and visits. They also did post-survey administration. While checking the results while the survey was being conducted and after it was already finished, no violations of the recommended procedure by group leaders and interviewers were found.

Based on the data shown in the Table 1, during the field works throughout all the 140 clusters included in the main sample 2783 HHs were surveyed in total, out of which 914, or 32.8%, were in Yerevan, 901, or 32.4%, were in other cities, and 968, or 34.8%, in villages. 75.2% of the surveyed HHs, i.e. 2092 HHs, are included in the target population, 24.8%, or 691 HHs, are their neighbors whose at least one member during the PPS did at least one migration trip. It should be mentioned beforehand that it was the first time in the framework of the Program (starting from 2015) that it had been impossible to survey all the HHs included in the main sample (i.e. 2100

<sup>1</sup>Total number of settlements in the Republic of Armenia is 1001, out of which 49 are urban, and 952 are rural.

HHs in total, or 15 HHs per cluster). The matter was that only 7 HHs out of 15 HHs included in the Arabkir cluster in Yerevan were surveyed.

Now we should go to the Table 2 that summarizes the monitoring results of the target population. The data indicates that like in the research done in 2015 and 2016 the percentage of filled out survey questionnaires is quite low. On average only 51.4% out of 4071 observations are filled out survey questionnaires. As it had been expected, the lowest indicator is registered in Yerevan, 45.6%, and the highest one – in rural settlements, 56.3%.

**Table 2. The summary of the results of the target population surveyed during the field works that have been done so far**

<b>Monitoring Results</b>	<b>Absolute numbers</b>				<b>Percentages (%)</b>

<b>18. Other</b>	<b>3</b>	-	-	3	<b>0,1</b>	-	-	0,5

65.8% out of the surveyed HHs included in the main sample did not have a MM. The indicator is lower than that registered not only in 2016 (68.4%), but even in 2015 (66.2%).<sup>2</sup> It means that the share of the HHs having a MM is larger than in the previous years (35% in 2017, while in 2015 it constituted 33.8%, and in 2016 – 31.6%). Logically, the share of the HHs not engaged in migration is significantly larger in Yerevan, 75.7%, than in other urban settlements, 59.2%, and rural settlements, 58.4%.

According to the data shown in the Table 2, the most serious reasons of the low number of filled out survey questionnaires are two: 'The HH is in Armenia, but unavailable during the survey,' 39% on average, and 'HH's refusal to answer,' 28%.<sup>3</sup> The same data points out that the percentages vary from one administrative territorial unit to another. The most significant difference is that in Yerevan the shares of such reasons as unavailability and refusal together constituted 86.1%, while in other urban settlements 54.4%, and in rural settlements 46.1%. Actually, it is a common pattern that is continuously captured by all sample surveys conducted in Armenia. Taking into account that the high rate of unavailability of the residents in Yerevan is conditioned by closed entrance of multiapartment buildings on one hand and the fact that they are indeed busy, such a difference between the percentages of refusals can be explained mostly by socio-psychological specifics of residents in urban and rural settlements.

The share of such reasons as 'No one lives at this address' and 'No information on the HH has been obtained' is much larger in Yerevan than in other urban settlements and rural settlements. Most probably, it is partially conditioned by internal migration and, to some extent, by the fact that residents in urban settlements, first and foremost in Yerevan, have a country house in neighboring villages.

In the framework of this study the important finding is that 7% (139) of the observations did not result in filled out survey questionnaire, as the respective HHs were abroad, i.e. were external migrants. 44 out of these HHs (2.2% of the observations that did not result in a filled out survey and 1% of all observed HHs) migrated in the PPS. The number of their members who went abroad, according to the neighbors, was 163, which means that in the PPS more than 1% of the HHs in Armenia migrated with all their members. It also should be noticed that the majority of these HHs were residents of other urban settlements (24 HHs, or 2%, of other urban HHs) and residents of rural settlements (18 HHs, or 1.5%, of rural HHs).

The date of departure of 95 HHs all the members of whom were abroad (2.3% of all monitored HHs) was impossible to know. Nevertheless, it can be assumed that the majority of them went abroad before the PPS. Most of them are the residents of rural settlements, 54 HHs (4.5% of the total number of all the monitored HHs). Those of other urban settlements were only 37 (only 3.1% of the total number of HHs from other urban settlements).

To sum up, the number of respondents in the main and the reserve samples in 35 clusters was not enough to do 15 surveys that were supposed to be conducted at the beginning (See Appendix 1).

22 out of the clusters are in Yerevan and 13 – in marzes. In the 23 clusters the number of the surveys that were failed was less than 5 and the respondents were replaced based on the route sampling strategy (each 10th was picked up). In regard to the rest 12 clusters, the number of the surveys that were failed was 5, and the replacement was done by choosing additional sample that included the HHs that were not covered in the main sample.

---

<sup>2</sup> <http://science.rau.am/rus/7/3592>, p. 6.

<sup>3</sup>It should be mentioned that none of the respondents refused to answer the questions.

<b>16. not having a MM</b>	3671	1562	956	1153	74,5	76,5	68,0	78,0
<b>18. Other<sup>4</sup></b>	11	1	1	9	0,2		0,1	0,6

The results of the survey of the neighboring HHs (those living on the right, left and in front of the HHs included in the main sample) are presented in the Table 3. Before proceeding with the results, it should be emphasized that it had been supposed that the total number of the surveyed neighboring HHs would constitute 6276, i.e. three times larger than the number of the surveyed HHs from the main sample. However, as not all the HHs in the main sample had three neighboring HHs, the final number was only 5617 (the rest can be found in the Appendix 2).

According to the data shown in the Table 3, the number of filled out survey questionnaires in the case of the neighboring HHs, as in the previous two years, is

<sup>4</sup>Including the only HH that was not able to participate in the survey, as it was in Armenian.

significantly lower than that of the HHs included in the main sample. The matter is that only HHs having MMs were surveyed and the number of their MMs was much lower.

Thus, the share of the surveyed HHs included in the main sample and having a MM is 19%, that of the neighboring HHs – only 12.3% (in Yerevan – 11.1% and 6.5% respectively, in other urban settlements – 22.3% and 15.4%, in rural settlements – 23.4% and 16.6%).

At the same time it should be noticed that this finding does not indicate that neighboring HHs are engaged in the migration less than those included in the main sample.

It is just conditioned by the difference in methodology of the observations of the HHs included in the sample and the neighboring ones, for instance, the survey of the neighboring HHs starts with the question aimed to find out whether they have a MM or not. Apparently, it gives a respondent an opportunity to avoid participating in the survey by answering 'Do not have a MM.' Hence, the number of the neighboring HHs refused to participate in the survey is extremely lower than that of the HHs included in the main sample (3.8% and 28% respectively).

The fact that some of the HHs having a MM quite often chose 'Do not have a MM as a reason for not participating in the survey is confirmed by interviewers' observations (many of them frequently dealt with the HHs that gave the same answer while, according to the preliminary data, they did have a MM).

*Appendix 1. The Findings of Monitoring of the HHs in the Main Sample by Marz, Strata and Cluster*
