Fieldwork Period:

27-10-2006 - 21-11-2006.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1000

Estimated Error:

3,2

Sample:

The sampling method is a stratified probabilistic sampling, multistage, with quota control in the final stage. The sample is stratified by region -Montevideo (capital city) and Interior (rest of the country). The interviewees are selected through multiple stages: in the first one are chosen the cities on each stratum; in the second one are selected the zones used as sample points (manzanas); in the third one, the house-holds in which the survey is made; and finally, the interviewees. In the first stage are selected automatically Montevideo (capital city), three cities of the first stratum (cities between 50.001 to 100.000 inhabitants), two of the cities of the second stratum (cities between 40.001 to 50.000 inhabitants), eight cities of the third stratum (cities between 20001 to 40000 inhabitants), ten cities of the fourth stratum (cities between 10001 to 20000 inhabitants), four cities of the fifth stratum (cities between 5001 to 10000 inhabitants), four of the sixth stratum (cities with less than 5000 inhabitants) and finally six rural areas of the seventh stratum (rural zone). These cities are selected randomly with proportional probabilities to their size. In the second stage are selected the census zones (manzanas) that are used as sample points, with proportional probabilities to their size. In the third

stage, the households are selected randomly through a systematic procedure. In each block a starting point is randomly chosen and the interval between the houses is predetermined by the general population density. In the fourth stage are selected the interviewees by quota (sex and age).

Remarks about sampling:

Substitution permitted: Response refusal, empty house hold, psychologically ill or physically challenged (eg, deaf-mute).

Survey procedure:

Personal Face to Face Interview
