14. What were the different stages in your sampling procedure?

The sample was drawn using multistage stratified random sampling. A four stage stratified random sampling method was used. In the first stage, 40 of the 543 parliamentary constituencies in the country were sampled. The 40 sampled constituency was distributed across the 18 states, with the smallest having at least one. The second stage was the sampling of Assembly constituencies within the parliamentary constituencies. In every state, a certain number of assembly constituencies form part of a parliamentary constituency. In every parliamentary constituency sampled, two assembly constituencies were selected using the stratified random sampling method. In all 80 assembly constituencies were sampled. The third stage of the sampling was the identification of two polling stations areas within each sampled assembly constituency. A total of 160 polling stations were identified. The selection of Polling stations was done by listing all the Pss within the sampled Assembly Constituency in the serial order ( as done by the Election Commission) and using a systematic random sampling procedure. The fourth and final stage of sampling was the selection of respondents. The sample was drawn from the latest electoral rolls of the selected polling stations. In every polling station 20/25 names were chosen by circular sampling with a random start. Depending on the number of interviews to be completed in a state, the respondents were asked to complete a minimum number of interviews in each polling booth.

15. What was the final number of clusters or sampling points?

No clusters
