Questionnaire:

The questionnaire designed to identify Iraqis political attitudes and their viewpoints toward the current and the near future political situation, in addition to attitudes toward some social issues. Iraqis values are among the important issues that covered by this survey. After designing the questionnaire, pretests were done on a pilot sample consisting of 20 households in different areas of Baghdad. Pretest findings were considered to modify the draft questionnaire and reach the final version.

Sample:

For the purpose of this research, the population frame was defined as all adult citizens (18 years and more) who lived in Iraqi urban and rural areas. The sample consisted of 2880 respondents in 18 governorates. The number of cases to be included for each governorate was determined by considering: 1) each governorates population as a percentage of the overall population; 2) the number of cases necessary to make valid regional comparisons; and 3) the rural area population as a percentage of the governorate population. A multi-stage probability-based sample was drawn utilizing

residential listings from Iraq's 1997 Population Census. Six sampling stages were deployed. First, the number of interviews was distributed among census districts (Qada) proportionally. Second, each Qada consisted of a number of census sub districts called (Nahia) which received its share of interviews proportionally. Nahias, in turn, consist of many blocks. At the third stage, blocks were regarded as the primary sampling units (PSU) in the urban areas, with 96 PSUs being selected using probability-proportional-to-size procedures. Thirty, twenty, or ten interviews were conducted in each block. Because more than seven years had passed since the census, the residential list in each street was not necessarily accurate, so each interviewer was asked to draw a map for the households located in the street he/she was supposed to work in. In the fifth stage, each interviewer selected, randomly, five households in the street using random tables. Finally, within each selected household, one respondent was randomly selected using the last birthday method. Because many elderly Iraqi citizens do not know their exact birthday, a list of random birthdays was used by interviewers when necessary. Due to the inaccuracy of the addresses in the rural areas, interviewers were trained on how to use simple rules in choosing the household which should be interviewed. This was also practiced on the urban Kurdistan cities which were not covered by the 1997 national census. Standard rules have been followed to choose blocks, streets and households. The rule of choosing the respondent is the same in all 2880 interviews. The margin of error was calculated in order to 1) incorporate the clustering effects of multistage sample design, and 2) to provide 95% confidence level. Although the overall margin of error is estimated at $\pm 3.017\%$ ($n=2701$), the margin of error varies across the 18 governorates included in the sample.

Survey procedure:

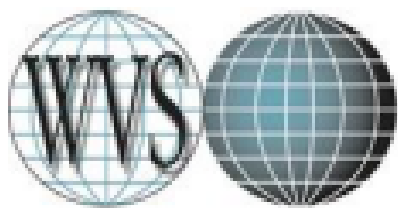

Personal Face to Face Interview

Fieldwork:

Interviews were completed by 108 interviewers. They have been engaged on a part time basis and cover regions about which they have the relevant local information and the knowledge on specific culture and mentality of the people in an area. The interviewers were very experienced professionals (almost all have a B.A. after four years of university education in social sciences). Each interviewer completed 30 or fewer interviews, and had administered at least four prior surveys. The fieldwork staff scrupulously completed interviews in a great majority of cases. Coders or research supervisors corrected most errors of interviewers. Interviewers knew in advance that field supervisors would check their work. At least one auditor was sent to each city to check 50% of completed questionnaire blanks, checked the accuracy of the map drawings of all Zukaks (streets), checked that all had been sampled correctly, and visited at least 20 households to be sure that interviews had been done correctly. The interviewers ensured many useful observations important for investigation concerning reaction of respondents, their interest for contents of research and situational conditions for carrying out the whole research. They had perceived that the questionnaire is smooth and understandable, but take long time to finish. Interviewers worked as teams. Each team consisted of males and females to ensure high response rate among female respondents, especially in the rural and more conservative areas.

Response rate:

The response rate was nearly (93.8 %). The rate of refusals was (2.8%). The higher refusal rate was in Irbil (23.8%), while the lowest rate was in Karbala, Diyala, and Dohuk (1.3%).
