Canada 2006_v20180912

CANADA 2006

Geographical scope:

Canada

Principal investigator(s):

Neil Nevitte Dept of Political Science University of Toronto 100 St. George St. Toronto, Ontario M5S 1A1 Canada Tel: 416-978-7170 E-mail: nnevitte@chass.utoronto.ca

Data Collection Organization:

Canadian Facts, Toronto

Fieldwork Period:

14-02-2006 - 08-04-2006.

Universe:

Missing, Both sexes, 18 and more years

Sample size:

2164

Estimated Error:

2,1

Sample:

In constructing a probability sample of this universe, the following conditions are met: 1. Each household in the universe has some known probability of selection. 2. No arbitrary judgment is exercised in determining which households are included, or which individual in each household is interviewed. A total of 2164 households were selected from 346 primary sampling units (EAs) widely spread throughout Canada. The sampling operation was performed at four distinct stages: 1. Determination of the numbers of primary sampling units (EAs) to be selected in each stratum. 2. Selection of EAs. 3. Selection of households. 4. Selection of one individual per household. 1. Selection Of Primary Sampling Points Cumulative EA household counts are computed within each community and the required number of PSUs are systematically selected. A random start and fixed interval method allows each EA a chance of selection proportionate to the number of households therein. 2. Selection Of Households Households are given an equal chance of selection in each EA. Statistics Canada EA maps are reproduced. Boundaries are clearly marked, start points, skip intervals and travel direction designated. Start points and start households are randomly chosen in each case. 3. Selection Of One Individual Per Household The final stage involves the selection of the one individual in each household to be interviewed. The procedure involves listing all individuals 18 years of age and over in each household. Individuals were not specifically screened for Canadian citizenship. The random selection of one respondent is controlled by a selection grid. SAMPLE

DISTRIBUTION One of the general features of the sample design is the expectation that an equal number of completions will be achieved in each selected EA irrespective of its location in Canada. However, it is recognized that completion rates vary significantly across the country given a constant level of effort. Prior to establishing the required number of EAs in total, decisions regarding anticipated completion rates for a specified level of effort are made. The total number of EAs drawn, the interval for household selection and the call back requirements are fashioned in anticipation of the sampling and interviewing effort required to maximize response rates and to ensure overall efficiency in the sampling and interviewing process.

Survey procedure:

Personal Face to Face Interview

Fieldwork:

Call-back procedures were designed to optimize expenditures of field resources for this study. The number of call-backs was initiated at different times of the day and on different days of the week to maximize completion rates. Completed questionnaires were always reviewed by supervisors prior to their return to head office. Incomplete or improperly conducted interviews were returned to the field for completion by either the same or, if necessary, a different interviewer. Interviewers were required to complete report forms for each assigned location. On-going tallies provided supervisory staff with the information necessary to re-assign work or address particular problems.

Response rate:

A total of 2,164 personal in-home interviews was completed. Based on total contacts of 8,192, a response rate of 26.4% percent was achieved. All interviewing for the study was conducted between August 3 and September 24, 2000. 8192 A - Total issued 496 B Not eligible (ill, dead, non-English speaking, not at this address) 2164 C - Total eligible 2146 D - Total questionnaires received 4121 E - non-responses (including non-contact; see note above under sample type) 1411 F - Refusals (including questionnaires less than half filled in) 3975 G - Non-contact (included in E) 146 H Other non-response (included in E)

Weighting:

According to age, gender, and region. The data for this project was weighted according to the most recent 2006 Statistics Canada figures. Weighting was undertaken to adjust the final, in-tab sample to reflect the total Canadian population of adults, 18 years of age and older, in terms of age within gender within community size within region.

V108.- I am going to read out a list of environmental problems facing many communities. Please, tell me how serious you consider each one to be here in your own community. Is it very serious, somewhat serious, not very serious or not serious at all? (Read out and code one answer for each problem): Poor water quality.

Canada 2006(N=2164)

I am going to read out a list of environmental problems facing many communities. Please, tell me how serious you consider each one to be here in your own community. Is it very serious, somewhat serious, not very serious or not serious at all? (Read out and code one answer for each problem):

Poor water quality.

	TOTAL	Sex			Age
