UNITED KINGDOM 2005

Geographical scope:
United Kingdom

Principal investigator(s):
Christian Welzel School of Humanities and Social Sciences International University of Bremen
P.O.Box 750 561 D-28725 Bremen Germany e-mail: c.welzel@iu-bremen.de

Data Collection Organization:
GfK NOP UK, London

Fieldwork Period:
01-12-2005 - 18-12-2005.

Universe:
National Population, Both sexes,Older than 15 years

Sample size:
1041

Questionnaire:
The order of the questions strictly followed the master questionnaire. No additional questions had been inserted in the programmed questionnaire, not even quota relevant questions. Quota had been recorded by a separate quota sheet. WVS question number or description of question: V50 to V54 V57 to V58 V91 to V94 V105 to V113 V115 V117 V122 to V124 V164 to V176 V178 to V183 V188 to V191 V193 to V197 V210 to V221 V231 to V233 V240 V248 to V252 Reason(s) not included: Short questionnaire, GfK survey

Sample:
NOP Random Location Approach, which is a quota sample of individuals with randomly selected sampling points. The sample design is essentially a 3-stage design, sampling first parliamentary constituencies, then enumeration districts within those selected constituencies and finally respondents within the enumeration districts: (1) Selection of parliamentary constituencies: The 639 parliamentary constituencies of Greta Britain are classified into the Register General's ten Standard Regions. Within each Standard Region, constituencies are classified into four urban/rural types. From the file of 639 constituencies, a sample of 175 must be drawn by random numbers. (2) Election of enumeration districts: Within each selected constituency, an enumeration district is selected. These EDs are selected at random, but with some stratification control so that the sample of EDs drawn is representative of the sample of constituencies and therefore of GB in demographic terms. Once the Eds have been selected, the profile of the aggregated set of EDs is checked against the national

profile to ensure that it is representative. Each ED is a small area, containing on average around 150 households. Each ED is therefore homogenous, with the people living within it being fairly similar in social grade terms. (3) Selection of respondents: For each selected ED, a list of all residential addresses is produced. This listing is taken from the Postal Address File, which is a listing of all addresses within Great Britain, and is updated monthly. The interviewer uses this list to identify the households at which they can interview. As in most of the countries involved, quota sampling had been used to select the respondents, a brief description of the methodology at the beginning of the methodological report seems to be useful. The respondent was selected using quota selection. Respondents were only selected if they matched the quotas given to the interviewers. Concerning substitution, any respondent fitting an appropriate quota profile could be interviewed instead of somebody with the same quotas, but who did not want to participate in the survey. Concerning stratification factors, region and size of town were used to design the sample and select appropriate sampling points.

Remarks about sampling:
Quota sample according to the following criteria: gender, age, professional status of respondent. For practical reasons, two constituencies (Orkney/Shetland and Western Isles) are not included in the sampling frame from which constituencies are selected. From the file of 639 parliamentary constituencies, a sample of 175 must be drawn by random numbers. Within each selected constituency, an enumeration district is selected. These EDs are selected at random, but with some stratification control so that the sample of EDs drawn is representative of the sample of constituencies and therefore of GB in demographic terms.

Survey procedure:
Personal Face to Face Interview

Fieldwork:
Face-to-face in-home interviews via CAPI (computer assisted personal interviews)

Weighting:
During and after data collection, representativeness of the sample with respect to nationally based criteria has been checked. Deviations from the population's distribution (criteria: gender, age, professional status of respondent, region, size of town) were corrected by a weighting variable built with the RIM weighting procedure. The population characteristics were obtained from GB mid 2003 population estimates; Office of National Statistics 2003 (class) and 2003 population estimates; FRS 2003.
