14. What were the different stages in your sampling procedure?

PLEASE WRITE IN:

The survey utilized a three (3) stage sampling design. At the first stage, census Enumeration Districts (EDs) for Trinidad & Tobago were selected with the selection being proportional to the size of the ED.

At the second stage, households within each ED are selected. This was done as follows:

ED maps for the selected areas were marked with a “start” house (dwelling unit) and a sampling interval. A random walk was drawn on the map showing the exact route the interviewer must take. The interviewer was instructed to follow the route and to select every “nth” household.

At the last or third stage, individuals within each household were selected. This was done so that the probability of selecting an individual within the household is the same for all eligible respondents. The last (most recent) birthday method was used to ensure this.

In cases where the selected respondent is not at home, a total of three attempts were made to contact the person. Failing this, the household was substituted and a new person was selected using the same last birthday method.

15. What was the final number of clusters or sampling points?

No clusters
