Sampling

SAMPLING PROCEDURE

A multistage cluster sample design was used to produce representative data for the target age range in Ecuador. Please refer to pages 17-18 of the report for further information.

RESPONSE RATE

The overall response rate was 69.4%.

WEIGHTING

Analysis weights were calculated by taking the inverse of the probability of selection of each participant. These weights were adjusted for differences in the age-sex composition of the sample population as compared to the target population.

Different weight variables are available per Step:

wStep1 - for interview data

wStep2 - for physical measures

wStep3 - for biochemical measures

This allows for differences in the weight calculation for each Step of the survey as the age-sex composition of the respondents to each Step can differ slightly due to refusal or drop out.
