## Sampling

### SAMPLING PROCEDURE

The 2007 India (CBSE) GSHS was a school-based survey of students in classes 8, 9, and 10. A two-stage cluster sample design was used to produce data representative of all students in classes 8, 9, and 10 in India (CBSE). At the first stage, schools were selected with probability proportional to enrollment size. At the second stage, classes were randomly selected and all students in selected classes were eligible to participate.

### RESPONSE RATE

The school response rate was 99%, the student response rate was 85%, and the overall response rate was 83%.

### WEIGHTING

The weighting formula used is:

$$W=W1 * W2 * f1 * f2 * f3.$$

The list below shows what each variable in the formula represents.

W1 - The inverse of the probability of selecting each school

W2 - The inverse of the probability of selecting each classroom

f1 - A school-level non response adjustment factor

f2 - A student-level non response adjustment factor calculated by classroom

f3 - A post stratification adjustment factor calculated by sex within grade
