STUDY TYPE

Other Household Survey

ABSTRACT

This study is a stratified cluster-randomised trial (CRT) designed to test Sugira Muryango's effects on promoting early childhood development (ECD) and preventing violence among families receiving the VUP social protection. The data collection for the study took place between January 2018 and September 2019. The trial was conducted within the Nyanza, Ngoma, and Rubavu districts with existing VUP programmes, selected to minimize the overlap with ECD interventions by government or nongovernmental organizations. All families in this study were eligible for one of two versions of the VUP programme: classic public works (cPW), which provides cash for (typically hard) manual labour; or the newer expanded public works (ePW), which provides cash for (typically lighter) labour and also provides access to livestock. Sugira Muryango, a 12-module coaching-based parenting intervention for vulnerable families (Ubudehe 1, the most extreme level of poverty) with children aged 6-36 months in Rwanda. Sugira Muryango is designed to: 1) Increase positive parent-child interactions with both male and female caregivers; 2) Reduce intimate partner violence and harsh discipline in the home; 3) Strengthen families through conflict resolution and shared decision making; 4) Improve caregiver mental health through emotion regulation and problem solving/executive function skill building; and, 5) Improve child health via care-seeking, hygiene and improved dietary diversity.

KIND OF DATA

Clinical data [cli]

UNIT OF ANALYSIS

Data is collected at 3 levels of observation: the child, the caregiver, and the household.

Each level of analysis has its own data file.

Household_id and timepoint can be used to merge files.

Version

VERSION DESCRIPTION

Version 2.1: Edited, cleaned and anonymous dataset for public distribution.

VERSION DATE

2020-01-20

VERSION NOTES

For each unit of analysis (i.e., Household, Caregiver, Child) these files have been created by merging cleaned de-identified datasets (Version 1). A total of 3 files are provided. These files have been de-identified according to Common Rules standards (<https://kb.wisc.edu/sbsedirbs/page.php?id=76643>). Files can be merged using subject id, timepoint, and household id. Overview of datasets - Caregiver dataset, Child dataset and Household dataset

Coverage

GEOGRAPHIC COVERAGE

Selected families in the districts of Rubavu, Nyanza and Ngoma.

Sampling

SAMPLING PROCEDURE

Study sample size includes the following: 1,049 families in total participated in the program. This resulted in 1,498 caregivers and 1,084 children enrolled in the study.

Families' participation in the VUP and selection into cPW and ePW is determined by governmental policies and was not under the control of the research team. Lists of families participating in the VUP program were obtained from government staff in each district.

Nonoverlapping, geographically defined clusters were created comprising at least 30 families participating in the cPW program or ten families participating in the ePW program, with some clusters containing both ≥ 30 cPW and ≥ 10 ePW households. Clusters were formed from one or more contiguous villages such that one CBV could provide services to all participating families in the cluster. Villages within the same cluster were selected to be as close to each other and as far apart from other clusters as possible. Due to the relative scarcity of the ePW families, 100% of clusters containing at least 10 ePW families were sampled for participation in the study. Clusters which contained cPW families (including combined clusters containing ePW families) were randomly sampled for inclusion into our study until we reached our target sample size of $\geq 1,040$ households. Randomization was performed by Laterite and occurred at the cluster level within strata defined by public works type (ePW only, combined ePW/cPW, and cPW only) and geographic sector. Within strata, clusters were assigned random numbers and placed on a ranked list. The first half of clusters on the randomly ranked list were assigned to treatment. In case of an uneven number of clusters per strata, a lottery was used to round the number assigned to treatment up or down. After assignment of the cluster, households were contacted by the data collection contractor and invited to participate in the study. Clusters were retained if at least five families in the cPW strata or at least one family in the ePW strata enrolled and had at least one child aged 6–36 months. We retained 48 ePW-only clusters, 38 ePW/cPW clusters, and 112 cPW-only clusters.

Neither the families nor the enumerators who conducted the assessments knew about a family's assignment to treatment versus control before they had completed the baseline assessment. All caregivers gave written informed consent for themselves and their eligible children ages 6–36 months.

RESPONSE RATE

Household Attrition

Between each wave of data collection, some households moved, declined to participate, or were otherwise not able to be surveyed. During field preparation, 1,062 households were drawn but only 1,054 were eligible to be surveyed at baseline. Five households moved or could not be found so the original baseline household sample was composed of 1,049 households.

At midline, 5 households moved or did not consent to participate, which represents a 0.5% attrition rate with respect to baseline data collection. At endline 8 households moved, could not be located, or did not consent to participate at endline. This represents an attrition rate of 1.2% with respect to baseline data collection and an attrition rate of 0.76% with respect to midline data collection.

Caregiver Attrition

A simple attrition calculation was performed by looking at counts of the “relationship to child” category after filtering out “new caregivers” that were enrolled after the intervention began.

A total of 1498 caregivers were surveyed at baseline (63.68% Mothers, 29.57% Fathers, 6.74% other, e.g., aunt, grandparent, etc.). At midline 1462 caregivers were surveyed, which represents an attrition rate of 2.4% considering only caregivers enrolled at baseline. At endline, 1353 caregivers enrolled at baseline answered the survey. This represents an attrition rate of 9.61% with respect to baseline and 7.38% with respect to midline.

***Note: If a simple count of observation per timepoints is requested in the caregiver dataset, the number of caregivers increases from baseline to endline data collection given the inclusion of new caregivers. There are also some changes in the caregiver type (e.g. some additional caregivers became new endline primary caregivers), so attrition estimates should be interpreted with caution because they depend on several “methodological decisions”.

Child Attrition

1084 children were assessed at baseline, 1078 at midline, and 1062 at endline. This yields an attrition rate of 0.55% at midline. At endline the attrition rate is 2.02% with respect to baseline and 1.48% with respect to midline.

DATES OF DATA COLLECTION

Start	End	Cycle
2018-04-01	2018-05-30	Baseline and post-intervention assessments
2018-08-01	2018-09-30	Midline (immediately post-intervention) evaluations
2019-08-01	2019-09-30	Endline (12-month post intervention) evaluations

DATA COLLECTION MODE

Computer Assisted Personal Interview [capi]

DATA COLLECTION NOTES

Direct child assessments, caregiver questionnaires and home observations were conducted in Kinyarwanda.

Enumerator training for baseline data collection occurred from January 29, 2018 to February 9, 2018. Training for surveys completed at the household included an overview of the study's objectives and methodology, sampling and replacement strategies, research ethics, the field team's responsibilities, adverse event reporting and the risk of harm protocol, and a thorough review of the survey instruments. A separate training occurred for those enumerators overseeing the MDAT and collection of Anthropometrics. After the training, an additional day of piloting all measures occurred in the field. A three-day refresher training occurred from April 18 to April 20, 2018. Prior to collection of midline data, a refresher training was held between August 1 and August 8, 2018. As there were no major changes to household survey questions, no pilot was done in

advance of midline data collection. A three-day refresher training was also held for the MDAT enumerators and a midline pilot of the MDAT occurred to test for interrater reliability. In preparation for endline data collection, a refresher training was held from August 5th to 9th, 2019.

All questionnaires were tested in pilot intervention research and followed a forward- and back-translation protocol from English to Kinyarwanda (Betancourt et al. 2018).

Data were entered on Android tablets by independent local research assistants blind to intervention status.

questionnaires

QUESTIONNAIRES

Excel spreadsheets with detailed information about the surveys is provided (for each timepoint) as supplemental materials.

The interviews with caregivers used structured questionnaires based on validated and piloted measures. Caregivers reported on themselves and the primary caregiver (the person who self-identified as knowing the child best, usually the biological mother) also reported on the child. The primary caregiver also reported on the household.

Questionnaire measures:

Caregivers report on the Child:

Questions for the caregiver regarding

Child feeding practices,

Child health

Care seeking for child illness

Child discipline [from MICS]

Child development - Ages and Stages Questionnaire (ASQ)-3

Caregiver Report on Self:

Completed by each primary caregiver in the study household. [If the primary caregiver had an intimate partner, the Caregiver Report on Self was completed by the intimate partner as well. Intimate partner surveys were not considered mandatory for household completion, but every attempt was made to complete this survey with both partners when applicable.]

Family unity

Shared decision making

Early childhood development knowledge [Knowledge and Attitudes: KAP]

Caregiver mental health [depression, anxiety [HSCL] and PTSD [PCL-C]

Caregiver alcohol use [AUDIT]

Daily hardships

Intimate partner violence [from DHS]

Caregiver Report on Household:

Completed by the primary caregiver in each study household or by his or her intimate partner and includes modules regarding the:

Family composition

Household assets

Social protection

Social protection program participation - VUP

Access to financial institutions, health care

Food security and meal frequencies

Water and sanitation

Observational child measures:

Home Observation for Measurement of the Environment (HOME);

Observation of Mother Child Interaction (OMCI.)

Malawi Development Assessment Tool (MDAT): This observation-based assessment was completed by each eligible child in the study household.

Child anthropometric measurements: Measurements of weight, height or length depending on age, and mid-upper arm circumference (MUAC) were taken for each eligible child in the study household.
