Sampling

SAMPLING PROCEDURE
The 2014 Maldives GSHS was a school-based survey of students in grades 8, 9, 10, 11, and 12, which are typically attended by students aged 13-17. A two-stage cluster sample design was used to produce data representative of all students in grades 8, 9, 10, 11, and 12 in Maldives. At the first stage, schools
were selected with probability proportional to enrollment size. At the second stage, classes were randomly selected and all

students in selected classes were eligible to participate.

RESPONSE RATE
The school response rate was 100%, the student response rate was 60%, and the overall response rate was 60%.

WEIGHTING
The weighting formula used is:
$W = W_1 * W_2 * f_1 * f_2 * f_3$.
The list below shows what each variable in the formula represents.
W_1 - The inverse of the probability of selecting each school
W_2 - The inverse of the probability of selecting each classroom
f_1 - A school-level non response adjustment factor
f_2 - A student-level non response adjustment factor calculated by classroom
f_3 - A post stratification adjustment factor calculated by sex within grade
