Sampling

SAMPLING PROCEDURE

A two-stage cluster sample design was used to produce data representative of all students in grades Ocatvo-Tercer Curso in Paraguay. At the first stage, schools were selected with probability proportional to enrollment size. At the second stage, classes were randomly selected and all students in selected classes were eligible to participate.

RESPONSE RATE

The school response rate was 100%, the student response rate was 87%, and the overall response rate was 87%.

WEIGHTING

The weighting formula used is:

$W = W1 * W2 * f1 * f2 * f3$.

The list below shows what each variable in the formula represents.

W1 - The inverse of the probability of selecting each school
 W2 - The inverse of the probability of selecting each classroom
 f1 - A school-level non response adjustment factor
 f2 - A student-level non response adjustment factor calculated by classroom
 f3 - A post stratification adjustment factor calculated by sex within grade
