Sampling

SAMPLING PROCEDURE

A multi-stage cluster sample design with stratification was used. Please refer to page 4-5 of report for further information.

RESPONSE RATE

Total response rate was generally good whereby 91 % of eligible participants completed all steps supposed to be done to complete data collection procedure. 98% of survey participants completed step 1 and 2 while only 2% refused to participate in the survey. A 6% of the participants completed step 1 and 2 but did not go for step 3.

WEIGHTING

Analysis weights were calculated by taking the inverse of the probability of selection of each participant. These weights were adjusted for differences in the age-sex composition of the sample population as compared to the target population.

Different weight variables are available per Step:

wStep1 - for interview data

wStep2 - for physical measures

wStep3 - for biochemical measures

This allows for differences in the weight calculation for each Step of the survey as the age-sex composition of the respondents to each Step can differ slightly due to refusal or drop out. Additionally, some countries perform subsampling for Step 2 and/or Step 3. When no subsampling is done and response rates do not differ across Steps of the survey, the 3 weight variables will be the same.

Data collection

DATES OF DATA COLLECTION

Start	End
2011-06	2011-07

DATA COLLECTION MODE

Face-to-face [f2f]

DATA COLLECTION NOTES

AccuChek and AccuTrend Plus (Roche) machines with their corresponding test strips were used for blood glucose, cholesterol and triglyceride measurements.
