Sampling

SAMPLING PROCEDURE

A multi-stage cluster sampling design was used to produce representative data for that age range in Vanuatu.

RESPONSE RATE

The overall response rate was 94%

WEIGHTING

Analysis weights were calculated by taking the inverse of the probability of selection of each participant. These weights were adjusted for differences in the age-sex composition of the sample population as compared to the target population.

Different weight variables are available per Step:

wStep1 - for interview data

wStep2 - for physical measures

wStep3 - for biochemical measures

This allows for differences in the weight calculation for each Step of the survey as the age-sex composition of the respondents to each Step can differ slightly due to refusal or drop out.

Data collection

DATES OF DATA COLLECTION

2011-07	2011-10

DATA COLLECTION MODE

Face-to-face [f2f]

DATA COLLECTION NOTES

Accutrend devices were used for blood glucose and cholesterol measurements.
