Sampling

SAMPLING PROCEDURE

A multi-stage cluster sample of households. One individual within the age range of the survey was selected per household. See part 3 of the report for further detail.

WEIGHTING

Analysis weights were calculated by taking the inverse of the probability of selection of each participant. These weights were adjusted for differences in the age-sex composition of the sample population as compared to the target population.

Different weight variables are available per Step:

wStep1 - for interview data

wStep2 - for physical measures

wStep3 - for biochemical measures

This allows for differences in the weight calculation for each Step of the survey as the age-sex composition of the respondents to each Step can differ slightly due to refusal or drop out.

Data collection

DATES OF DATA COLLECTION

Start	End
2019-07	2019-11

DATA COLLECTION MODE

Face-to-face [f2f]

DATA COLLECTION NOTES

Cardiochek Plus devices were used for the blood measures.

Questionnaires

QUESTIONNAIRES

Tobacco questions were significantly modified from the standard STEPS questionnaire.
