## Sampling

## SAMPLING PROCEDURE

Initially, the sample was designed to include 110 households in each of the 22 governorates, amounting to a total of 2 420 households nationally. The sample is representative of the population of Yemen and of the governorates (administrative level 1), with a 95 percent confidence level and a 10 percent margin of error. Eventually, 2 500 households were interviewed, of which 51.4 percent were engaged in agricultural activities (crop, livestock, or both), and only 1.4 percent were engaged in fish production and sale in the 12 months preceding the survey.

## WEIGHTING

Data were weighted at the analytical stage to ensure a proportionate representation of the population. Weights were computed based on population size and wealth proxies (access to drinkable water and education of the heads of household).
